# Center for Open Source Data and AI Technologies (CODAIT)

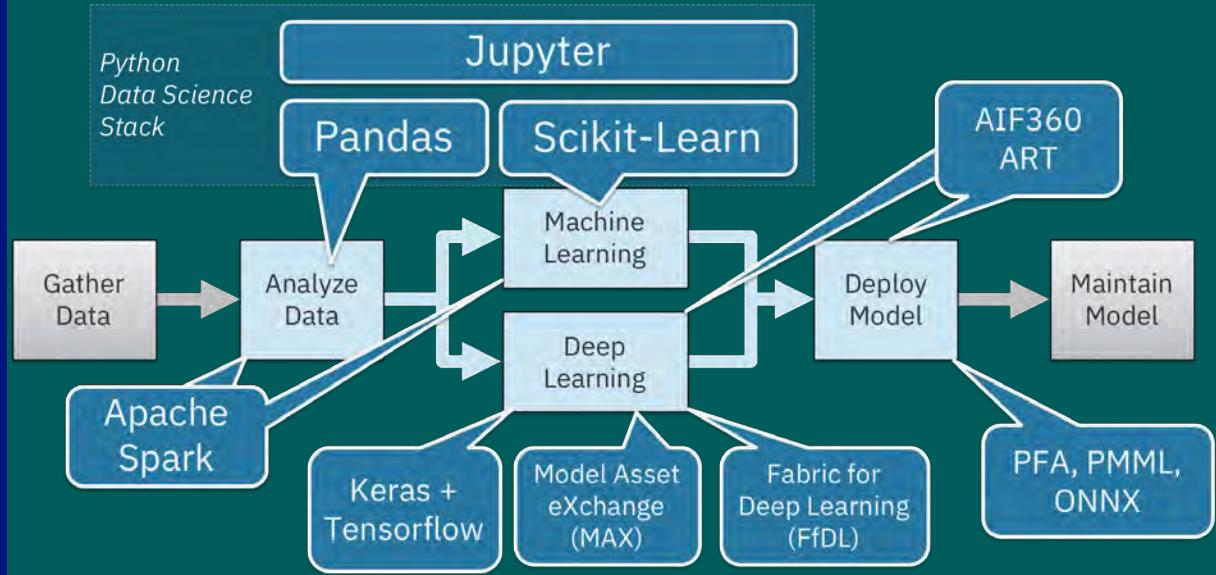

**Code** – Build and improve practical frameworks to enable more developers to realize immediate value.

**Content** – Showcase solutions for complex and real-world AI problems.

**Community** – Bring developers and data scientists to engage with IBM

- Team contributes to over **10 open source projects**
- **17 committers** and many contributors in Apache projects
- Over **1100 JIRAs** and **66,000 lines of code** committed to Apache Spark itself; over **65,000 LoC** into SystemML
- Over **25 product lines** within IBM leveraging Apache Spark
- Speakers at over 100 conferences, meetups, unconferences and more

Improving Enterprise AI lifecycle in Open Source

**CODAIT**  
codait.org

# Who We Are

We are a group of data scientists and open source developers based out of IBM's Watson West building in San Francisco. CODAIT was formerly known as the Spark Technology Center. In addition to the Apache Spark data science stack, the Center's expanded mission will include core frameworks for deep learning. We aim to make AI models dramatically easier to create, deploy, and manage in the enterprise.

# IBM's history of actively fostering balanced communities

# AI and machine learning

IBM recently open sourced some key technologies for AI, including:

- The [AI Fairness 360 toolkit](#) (AIF360), an open source software toolkit that can help detect and remove bias in machine learning models
- The [Adversarial Robustness Toolbox](#) for rapid crafting and analysis of attack and defense methods for machine learning models
- [Fabric for Deep Learning](#) (FfDL, pronounced fiddle), a deep learning platform offering TensorFlow, Caffe, PyTorch etc. as a Service on Kubernetes

This space is as hot as they come, so look for more open source innovation from IBM in the months to come.

# Project Debater

Project Debater is the first AI system that can debate humans on complex topics. The goal is to help people build persuasive arguments and make well-informed decisions.

[Watch a live debate](#)

# Progress in Deep Learning

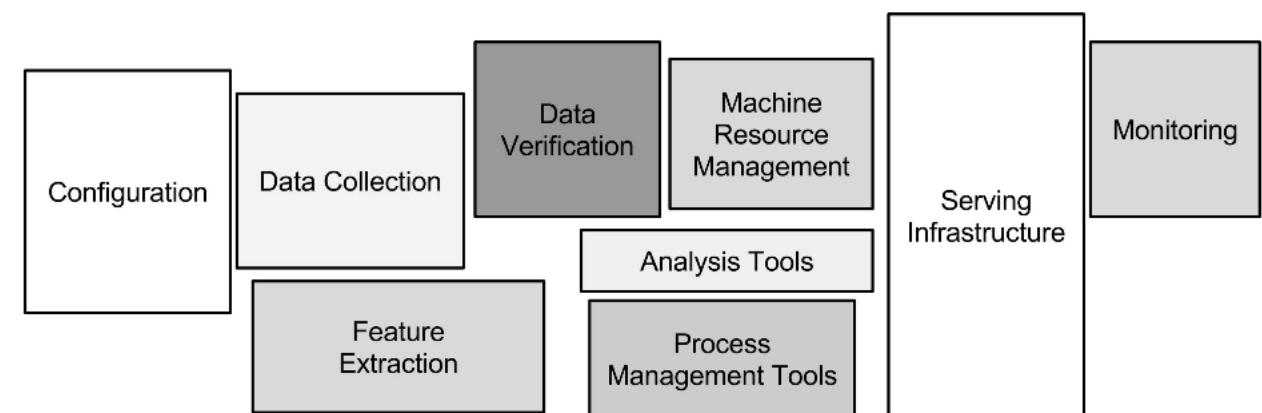

## Deep Learning = Training Artificial Neural Networks

- 25 million “neurons”
- 100 million connections (parameters)

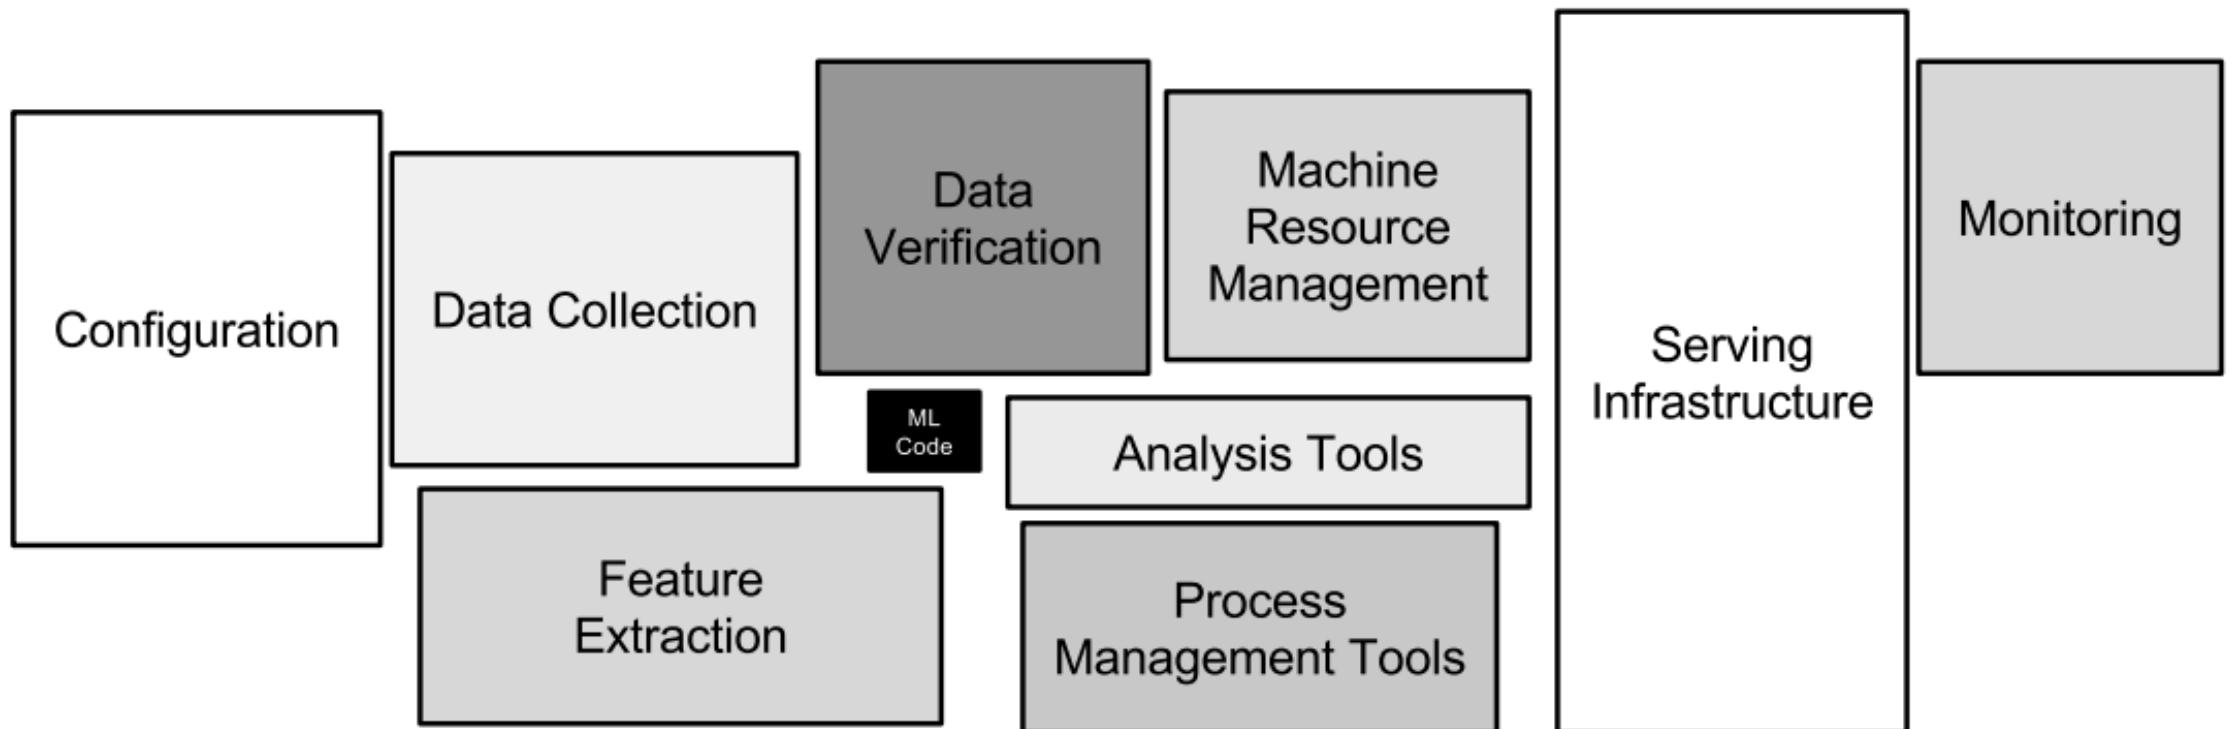

## A human brain has:

- 200 billion neurons
- 32 trillion connections between them

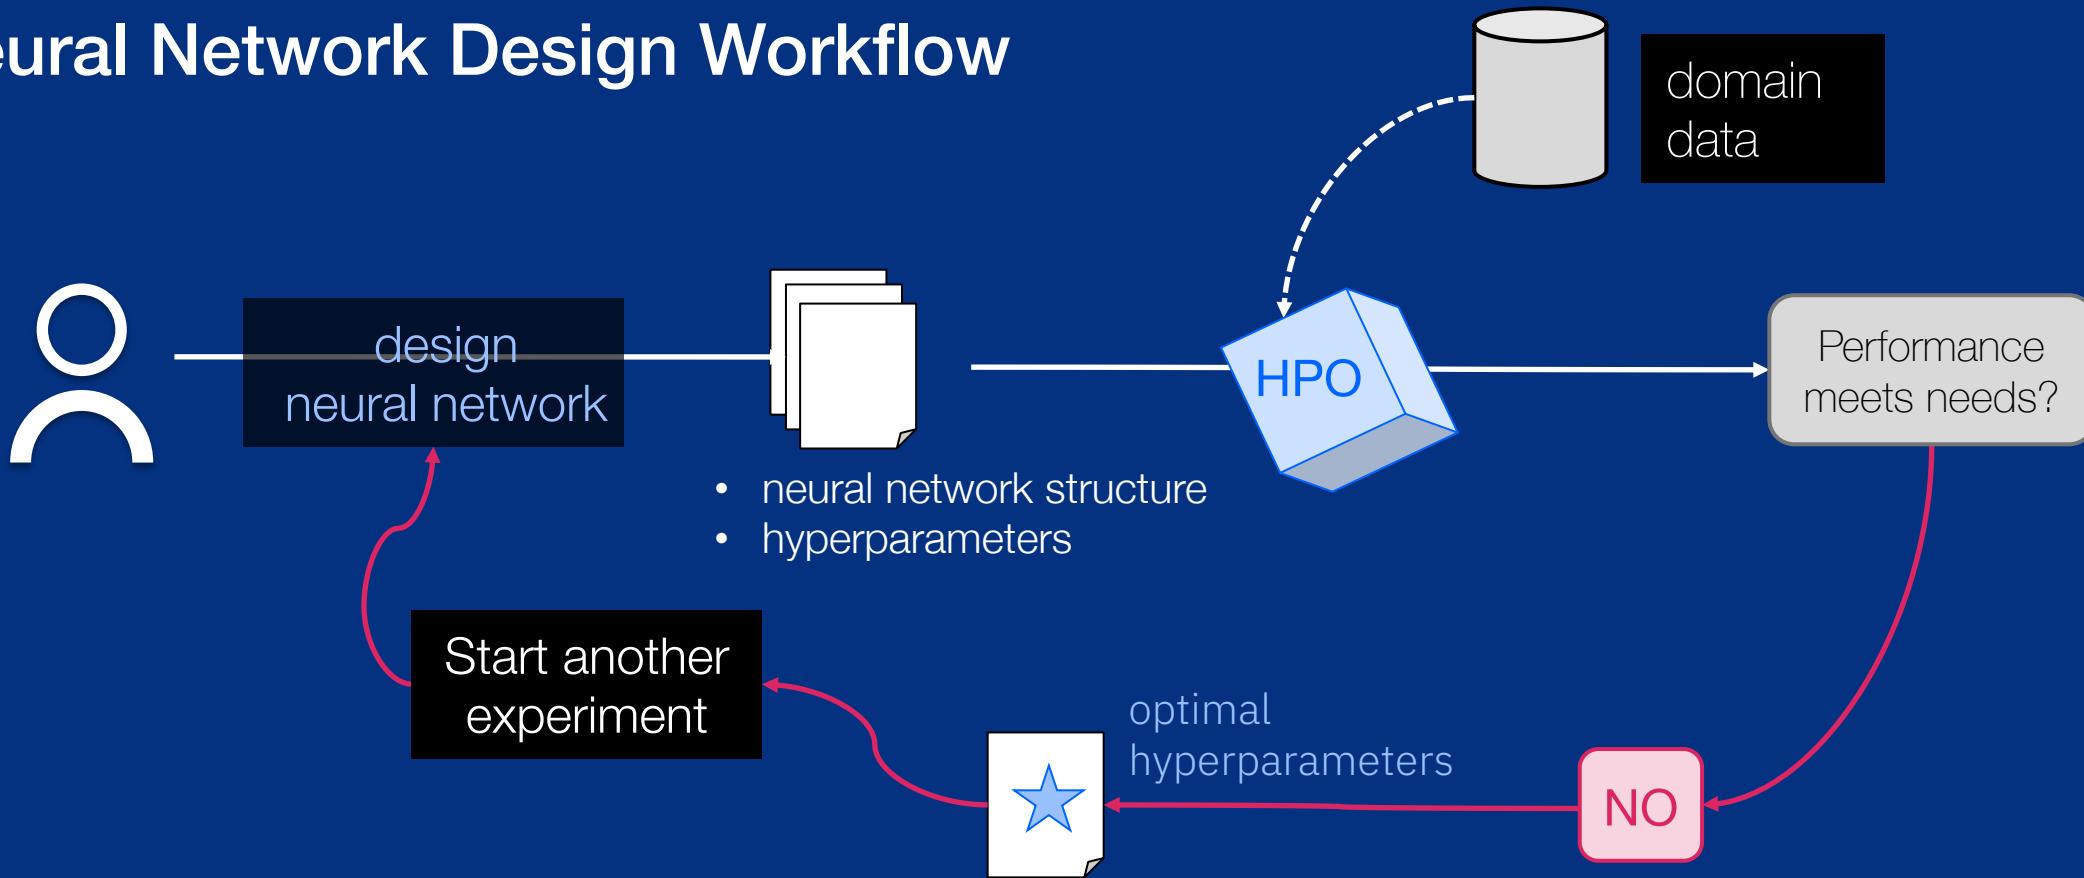

# ML Code

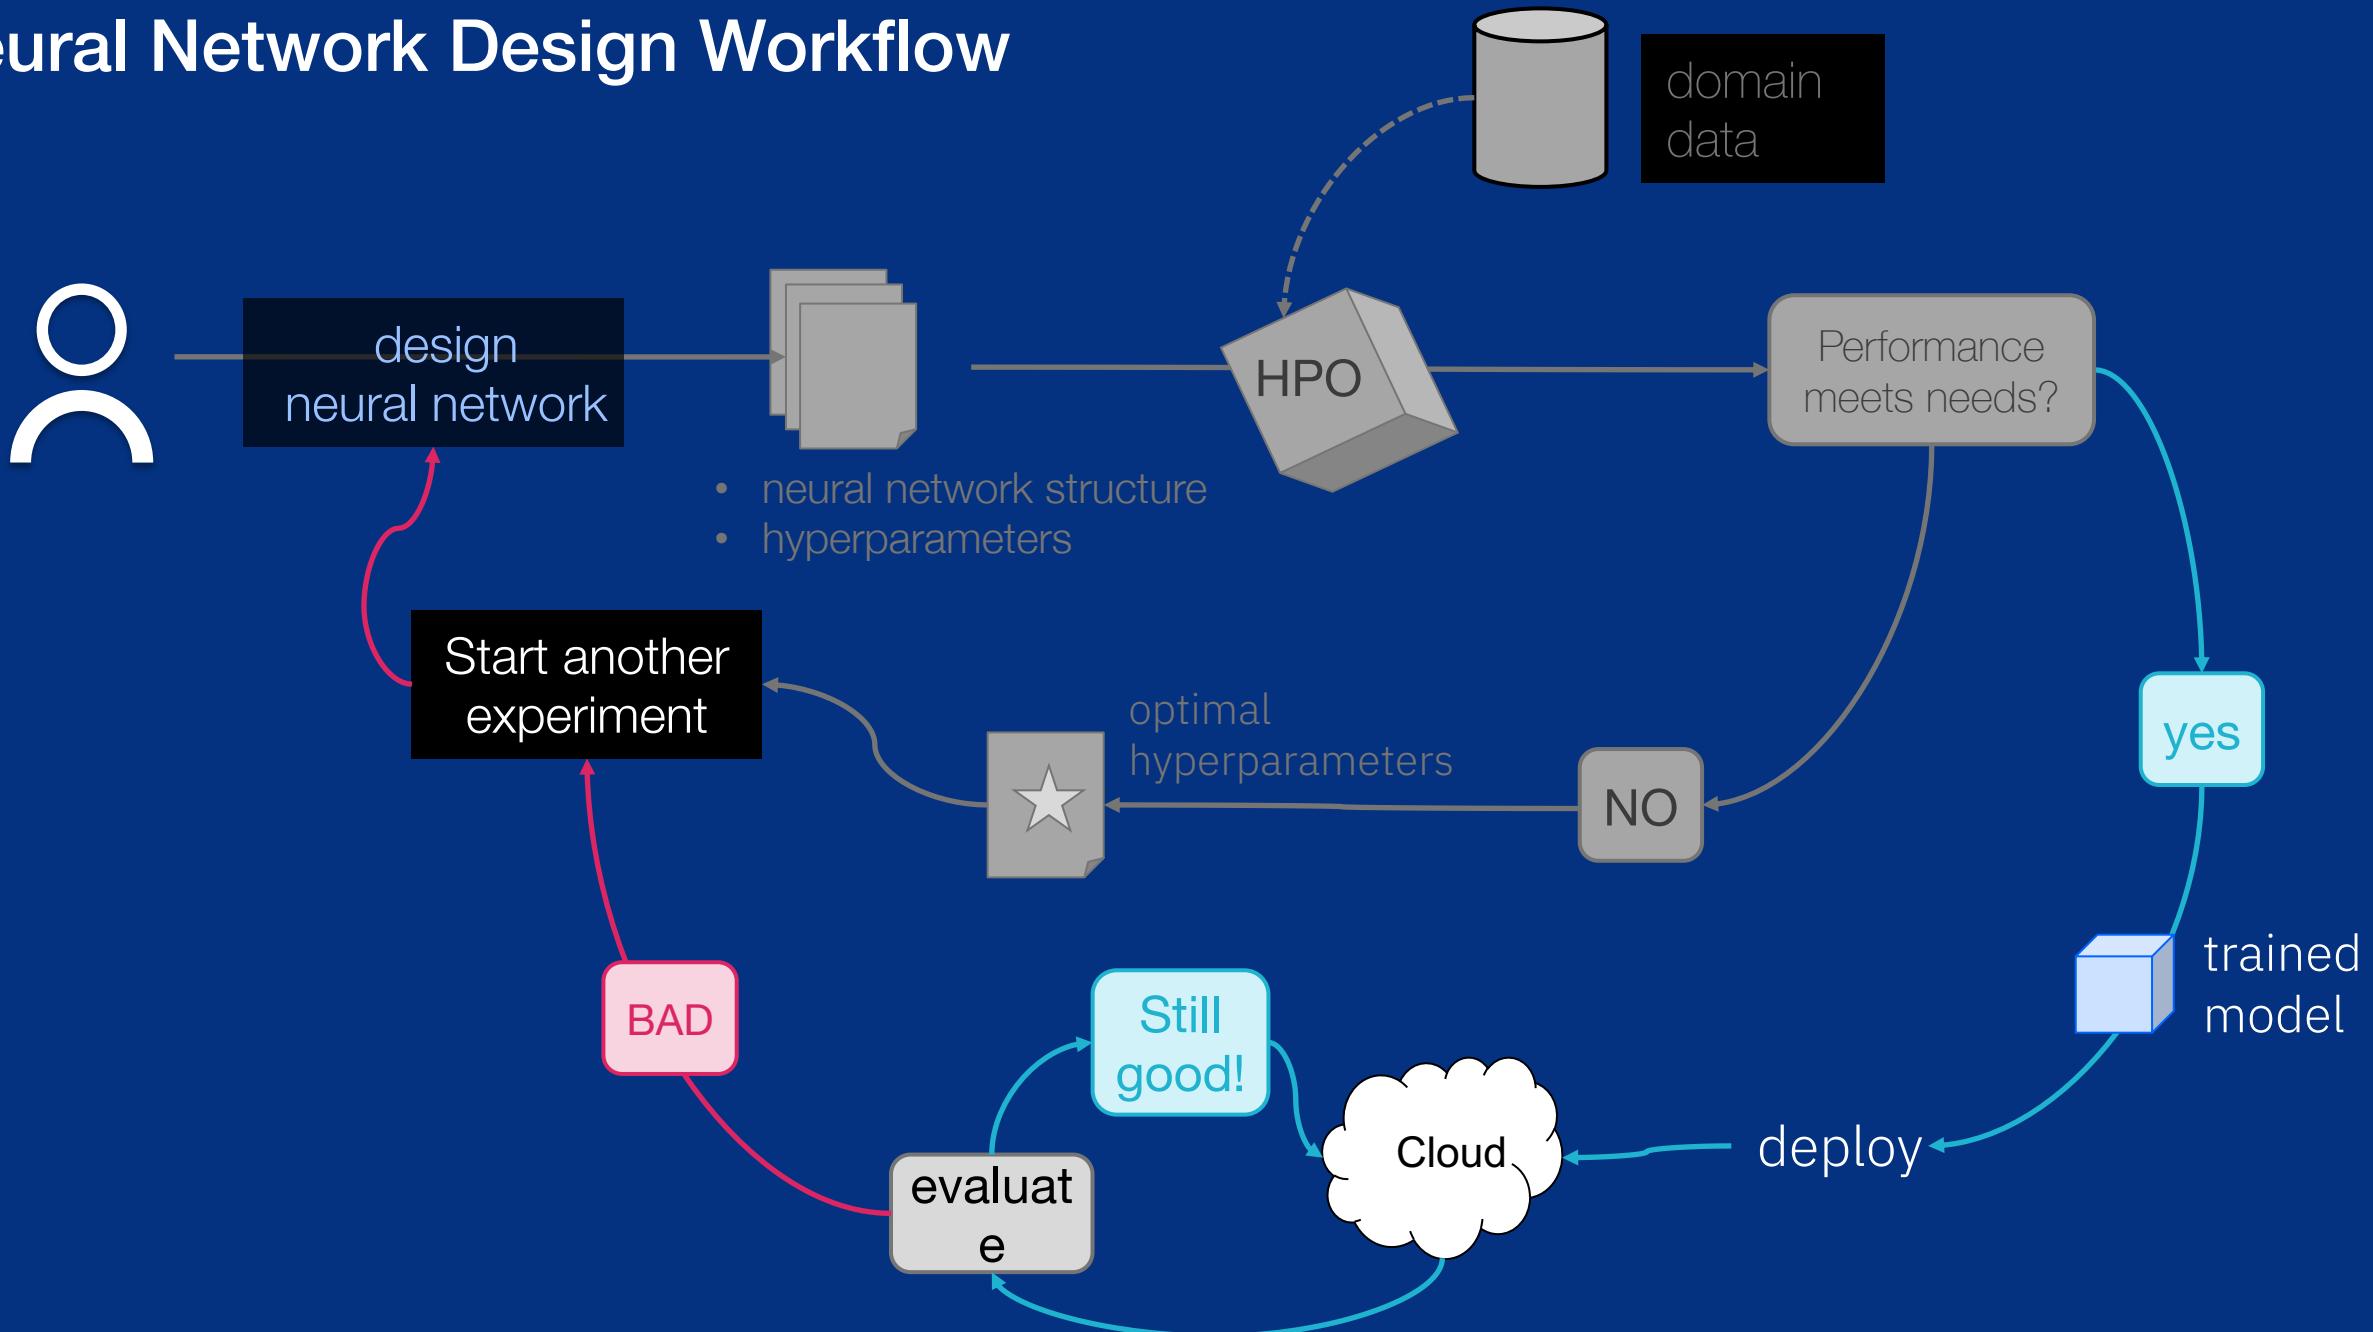

# In reality ...

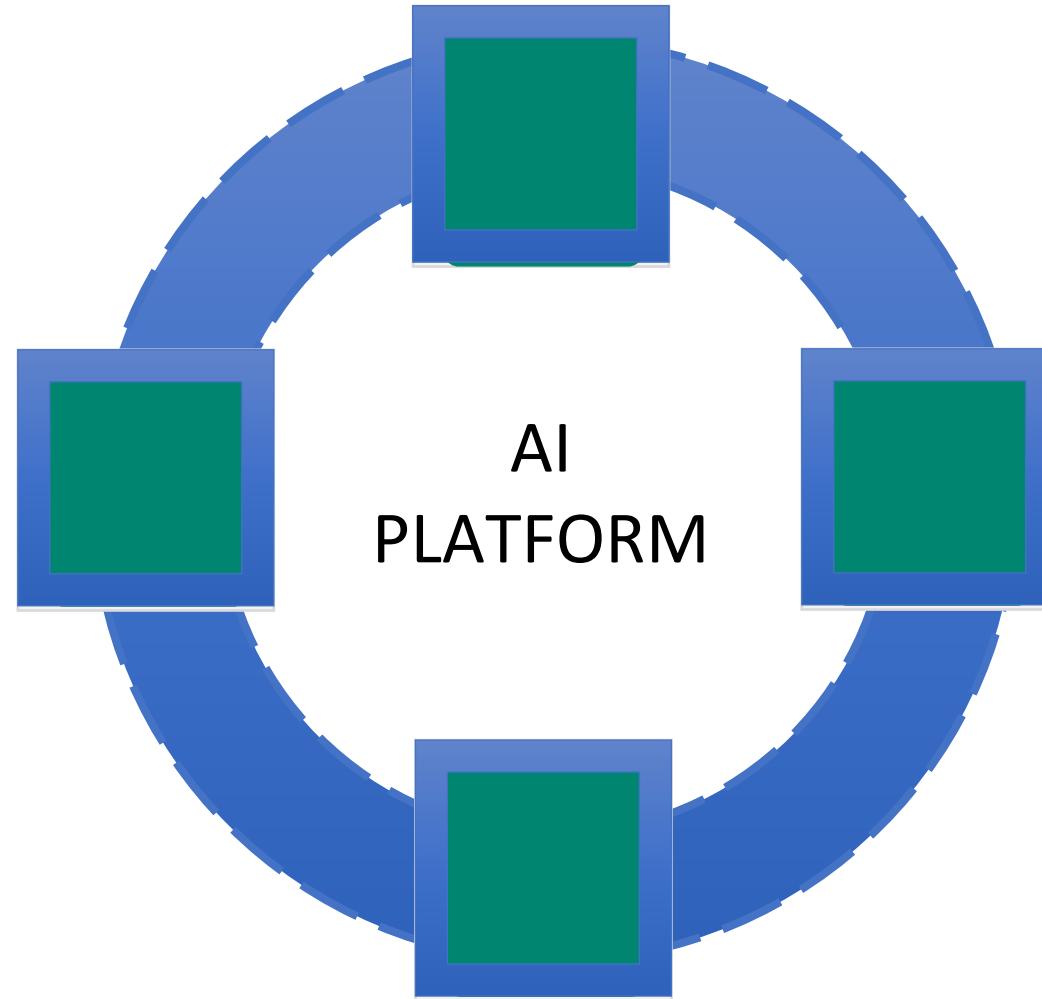

# Neural Network Design Workflow

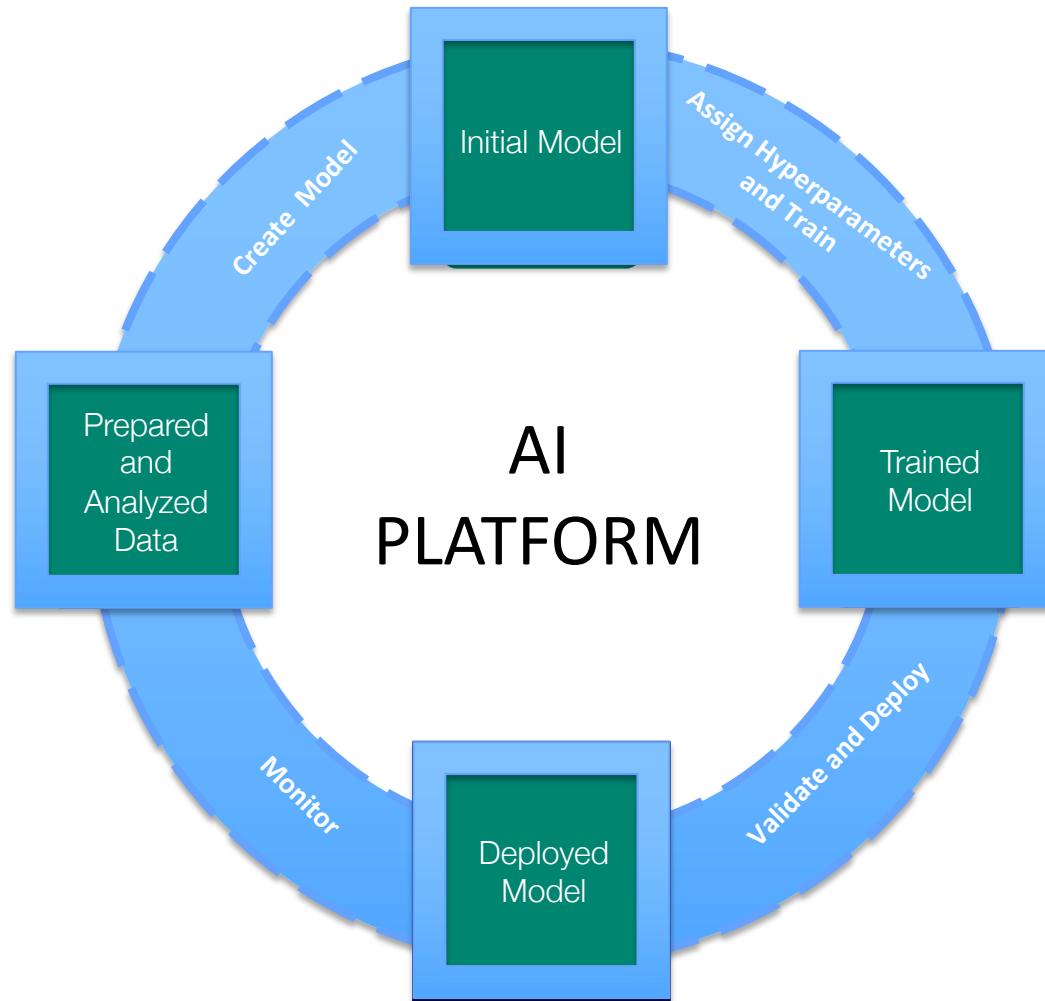

# Neural Network Design Workflow

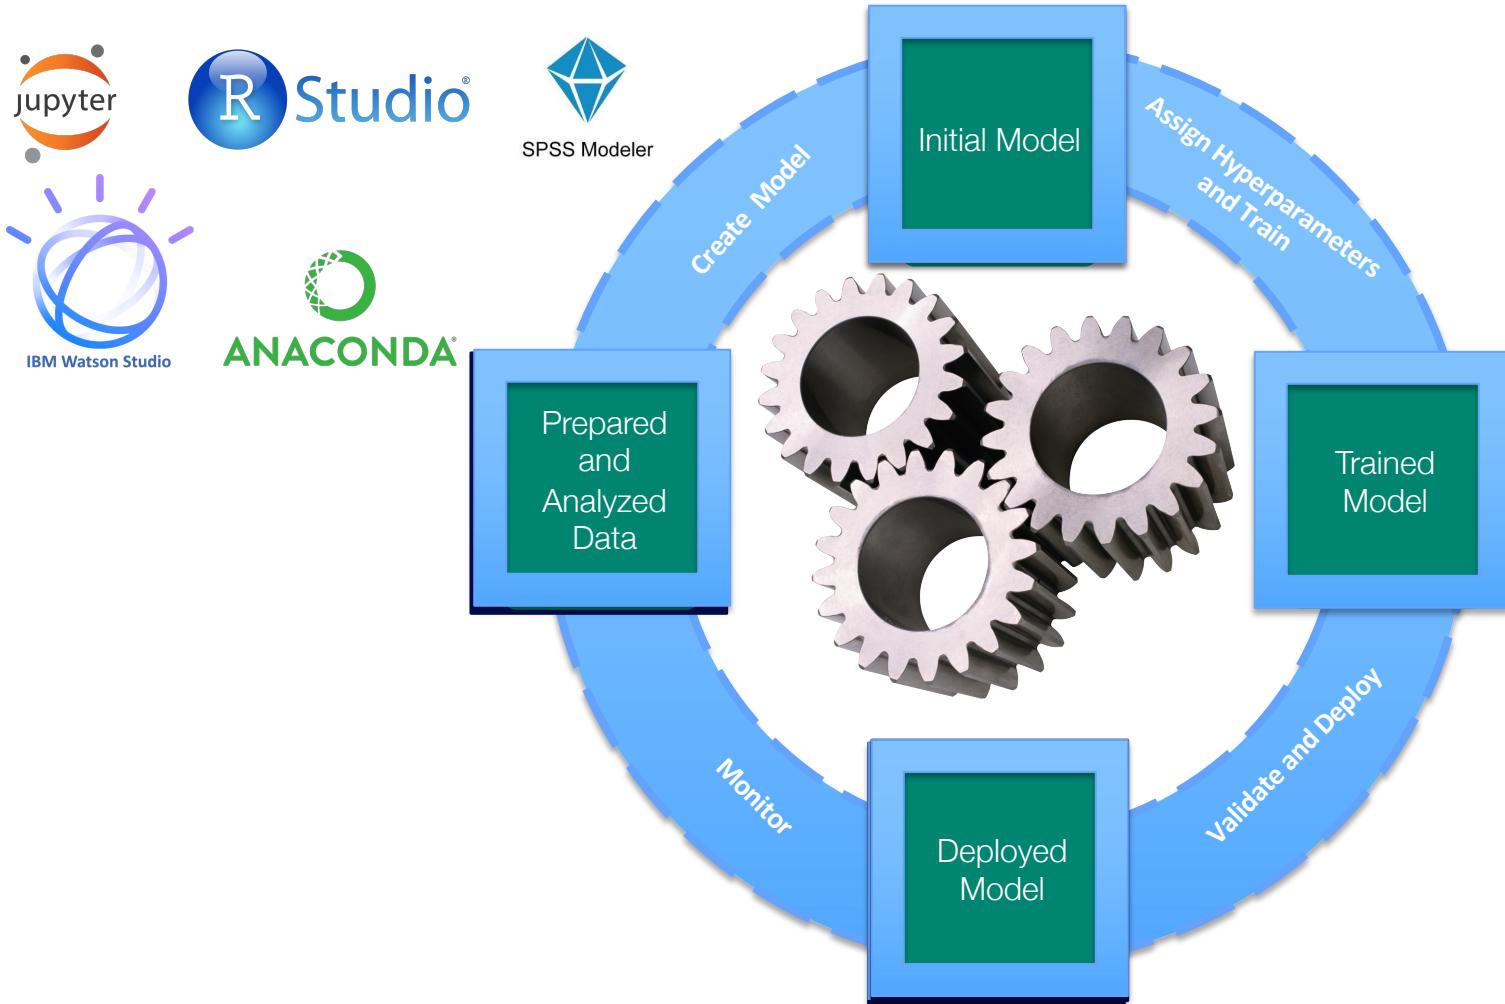

Let's understand it from the context of an AI Lifecycle

# We need a Cloud native AI Platform to build, train, deploy and monitor Models

# Many tools available to build initial models

# Neural Network Modeller within Watson Studio

An intuitive drag-and-drop, no-code interface for designing neural network structure

The screenshot shows the IBM Watson Neural Network Modeller interface. On the left, a sidebar lists categories like Input, Activation, Convolution, Core, Metric, Loss, Normalization, Embedding, Recurrent, and Optimizer. A blue bracket on the left points to the 'Conv 2d' and 'Pool 2d' items under Convolution. In the center, a network diagram shows an 'Image Data' node connected to a sequence of layers: 'Conv 2d' (with a red arrow pointing to it), 'ReLU', 'Conv 2d', 'ReLU', 'Conv 2d', 'ReLU', 'Pooling 2d', 'ReLU', 'Dense', 'ReLU', 'Dropout', 'Dense', 'Softmax', 'Accuracy', 'Sigmoid Cross-E...', and 'RMSprop'. A blue arrow points from the 'Conv 2d' node in the diagram to its corresponding configuration panel on the right. The configuration panel is titled 'Conv 2d' and includes fields for 'Number of filters\*', 'Kernel row\*', 'Kernel col\*', 'Stride row', 'Stride col', 'Border mode' (with 'VALID' and 'SAME' options), and 'Initialization' (set to 'glorot\_normal'). A 'Save' button is at the bottom right. A blue bracket on the right side points to the 'Save' button and lists four export options: 'Generate CPU or GPU compatible code', 'Save as popular framework code', 'Export as a python notebook', and 'Execute as batch experiment'.

Real-time validation of network flow

Drag-and-drop network layers

- Generate CPU or GPU compatible code

- Save as popular framework code
- Export as a python notebook
- Execute as batch experiment

- Customize layer by setting hyperparameters

# Enter: Adversarial Robustness Toolbox

**ART**

# IBM Adversarial Robustness Toolbox

<https://github.com/IBM/adversarial-robustness-toolbox>

ART is a library dedicated to adversarial machine learning. Its purpose is to allow rapid crafting and analysis of attack and defense methods for machine learning models. The Adversarial Robustness Toolbox provides an implementation for many state-of-the-art methods for attacking and defending classifiers.

# ART

The Adversarial Robustness Toolbox contains implementations of the following attacks:

Deep Fool (Moosavi-Dezfooli et al., 2015)  
Fast Gradient Method (Goodfellow et al., 2014)  
Jacobian Saliency Map (Papernot et al., 2016)  
Universal Perturbation (Moosavi-Dezfooli et al., 2016)  
Virtual Adversarial Method (Moosavi-Dezfooli et al., 2015)  
C&W Attack (Carlini and Wagner, 2016)  
NewtonFool (Jang et al., 2017)

The following defense methods are also supported:

Feature squeezing (Xu et al., 2017)  
Spatial smoothing (Xu et al., 2017)  
Label smoothing (Warde-Farley and Goodfellow, 2016)  
Adversarial training (Szegedy et al., 2013)  
Virtual adversarial training (Miyato et al., 2017)

# AI Fairness 360

<https://github.com/IBM/AIF360>

AIF360 toolkit is an open-source library to help detect and remove bias in machine learning models.

The AI Fairness 360 Python package includes a comprehensive set of metrics for datasets and models to test for biases, explanations for these metrics, and algorithms to mitigate bias in datasets and models.

## Toolbox

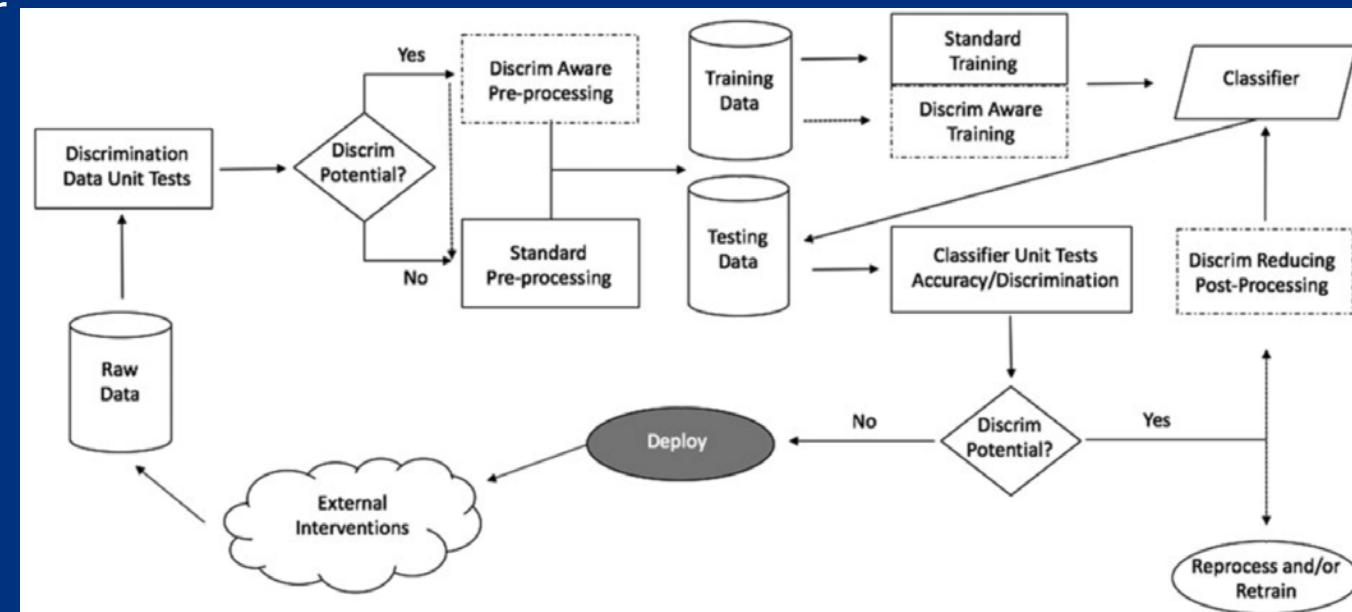

Fairness metrics (30+)  
Fairness metric explanations  
Bias mitigation algorithms (10+)

## Supported bias mitigation algorithms

Optimized Preprocessing (Calmon et al., 2017)  
Disparate Impact Remover (Feldman et al., 2015)  
Equalized Odds Postprocessing (Hardt et al., 2016)  
Reweighting (Kamiran and Calders, 2012)  
Reject Option Classification (Kamiran et al., 2012)  
Prejudice Remover Regularizer (Kamishima et al., 2012)  
Calibrated Equalized Odds Postprocessing (Pleiss et al., 2017)  
Learning Fair Representations (Zemel et al., 2013)  
Adversarial Debiasing (Zhang et al., 2018)  
Meta-Algorithm for Fair Classification ([Celis et al.. 2018](#))

## Supported fairness metrics

Comprehensive set of group fairness metrics derived from selection rates and error rates  
Comprehensive set of sample distortion metrics  
Generalized Entropy Index (Speicher et al., 2018)

## AI Fairness 360 Open Source Toolkit

This extensible open source toolkit can help you examine, report, and mitigate discrimination and bias in machine learning models throughout the AI application lifecycle. Containing over 70 fairness metrics and 10 state-of-the-art bias mitigation algorithms developed by the research community, it is designed to translate algorithmic research from the lab into the actual practice of domains as wide-ranging as finance, human capital management, healthcare, and education. We invite you to use it and improve it.

[API Docs ↗](#)[Get Code ↗](#)

Not sure what to do first? Start here!

### Read More

Learn more about fairness and bias mitigation concepts, terminology, and tools before you begin.

### Try a Web Demo

Step through the process of checking and remediating bias in an interactive web demo that shows a sample of capabilities available in this toolkit.

### Watch Videos

Watch videos to learn more about AI Fairness 360.

### Read a paper

Read a paper describing how we designed AI Fairness 360.

### Use Tutorials

Step through a set of in-depth examples that introduces developers to code that checks and mitigates bias in different industry and application domains.

### Ask a Question

Join our AIF360 Slack Channel to ask questions, make comments and tell stories about how you use the toolkit.

### View Notebooks

Open a directory of Jupyter Notebooks in GitHub that provide working examples of bias detection and mitigation in sample datasets. Then share your own notebooks!

### Contribute

You can add new metrics and algorithms in GitHub. Share Jupyter notebooks showcasing how you have examined and mitigated bias in your machine learning applications.

So AI in general and  
Deep Learning in  
particular are very  
iterative and repetitive.

And they need Cloud.

Why?

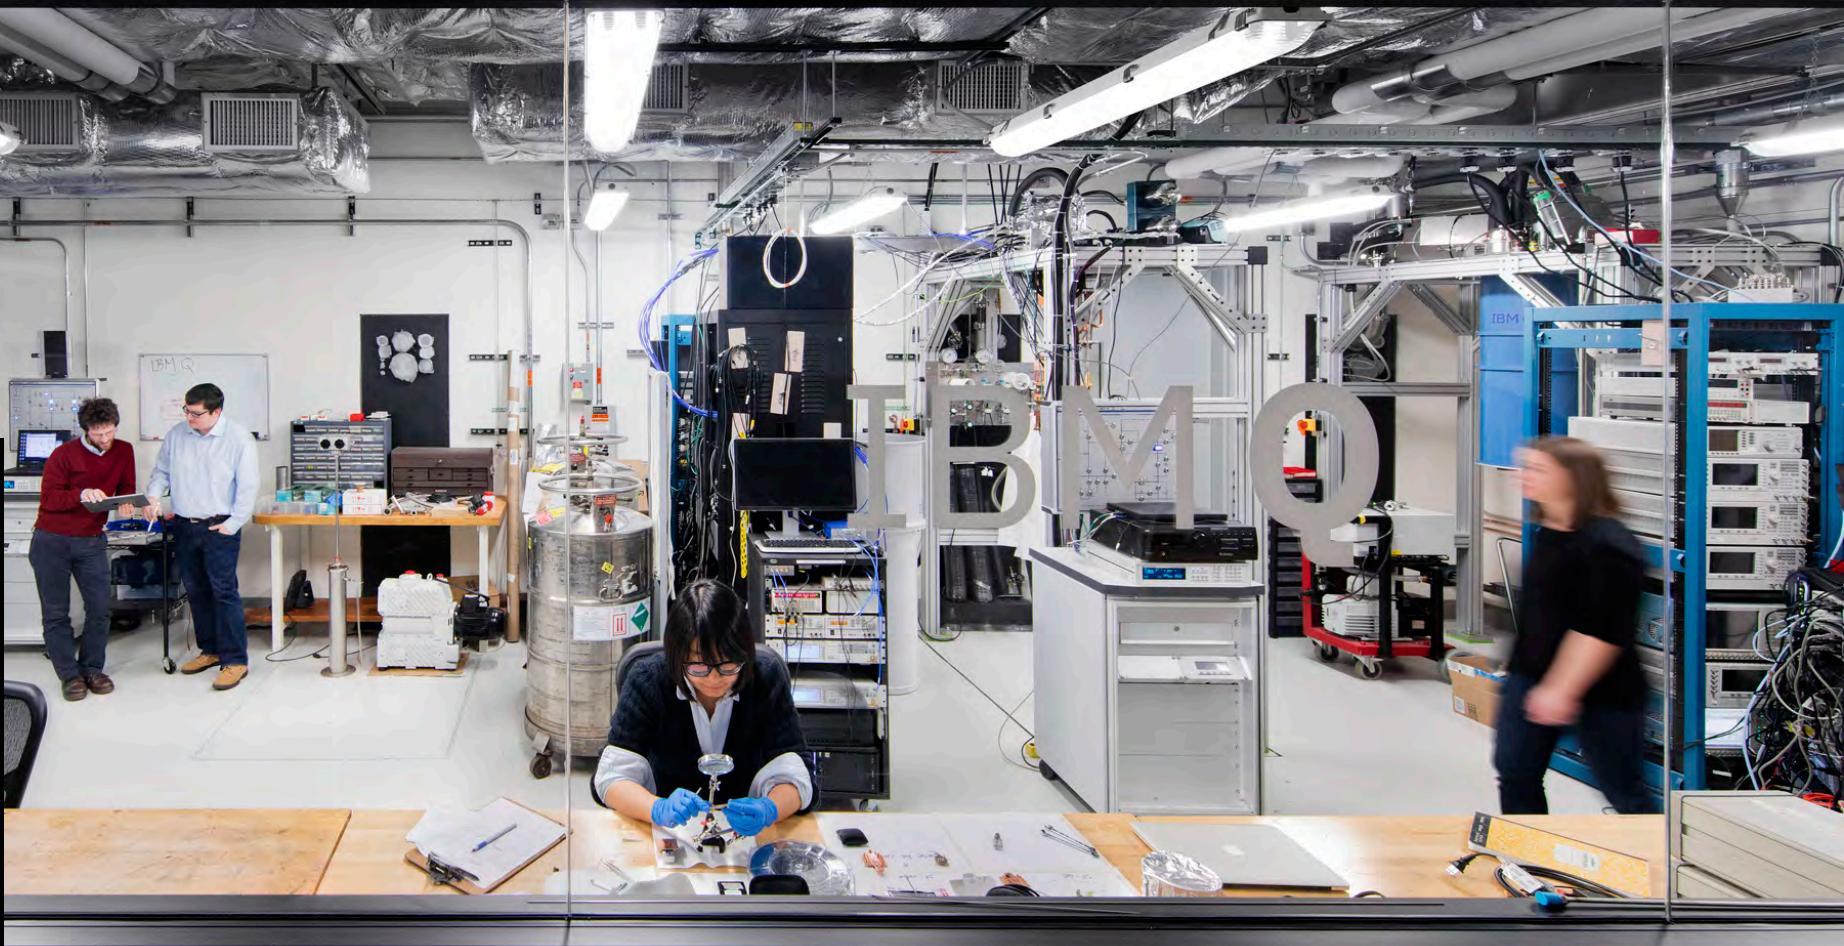

IBM Cloud

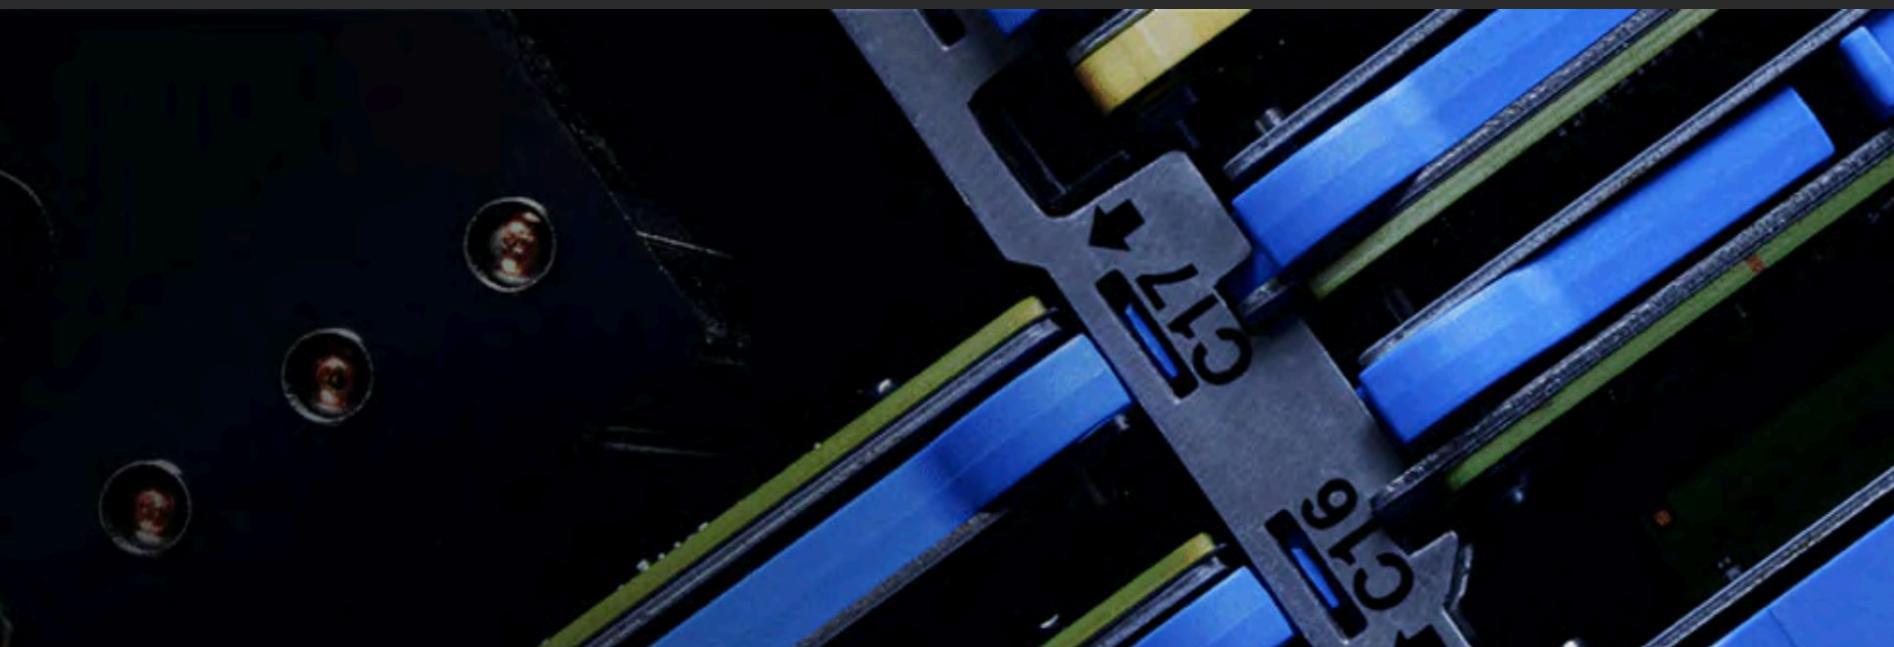

AI requires  
the strength  
of HPC &  
GPUs

Ability to  
scale AI  
workloads on  
demand

# Ability to utilize various technologies and achieve high performance computing.

## 1. Model/Data Parallelism

## 2. MPI/NCCL

NCCL (pronounced "Nickel") is a stand-alone library of standard collective communication routines for GPUs, implementing all-reduce, all-gather, reduce, broadcast, and reduce-scatter. It has been optimized to achieve high bandwidth on platforms using PCIe, NVLink, NVswitch, as well as networking using InfiniBand Verbs or TCP/IP sockets.

NCCL supports an arbitrary number of GPUs installed in a single node or across multiple nodes, and can be used in either single- or multi-process (e.g., MPI) applications.

A photograph of a city skyline with several skyscrapers against a blue sky with white clouds.

To scale we need to go  
Cloud native for AI

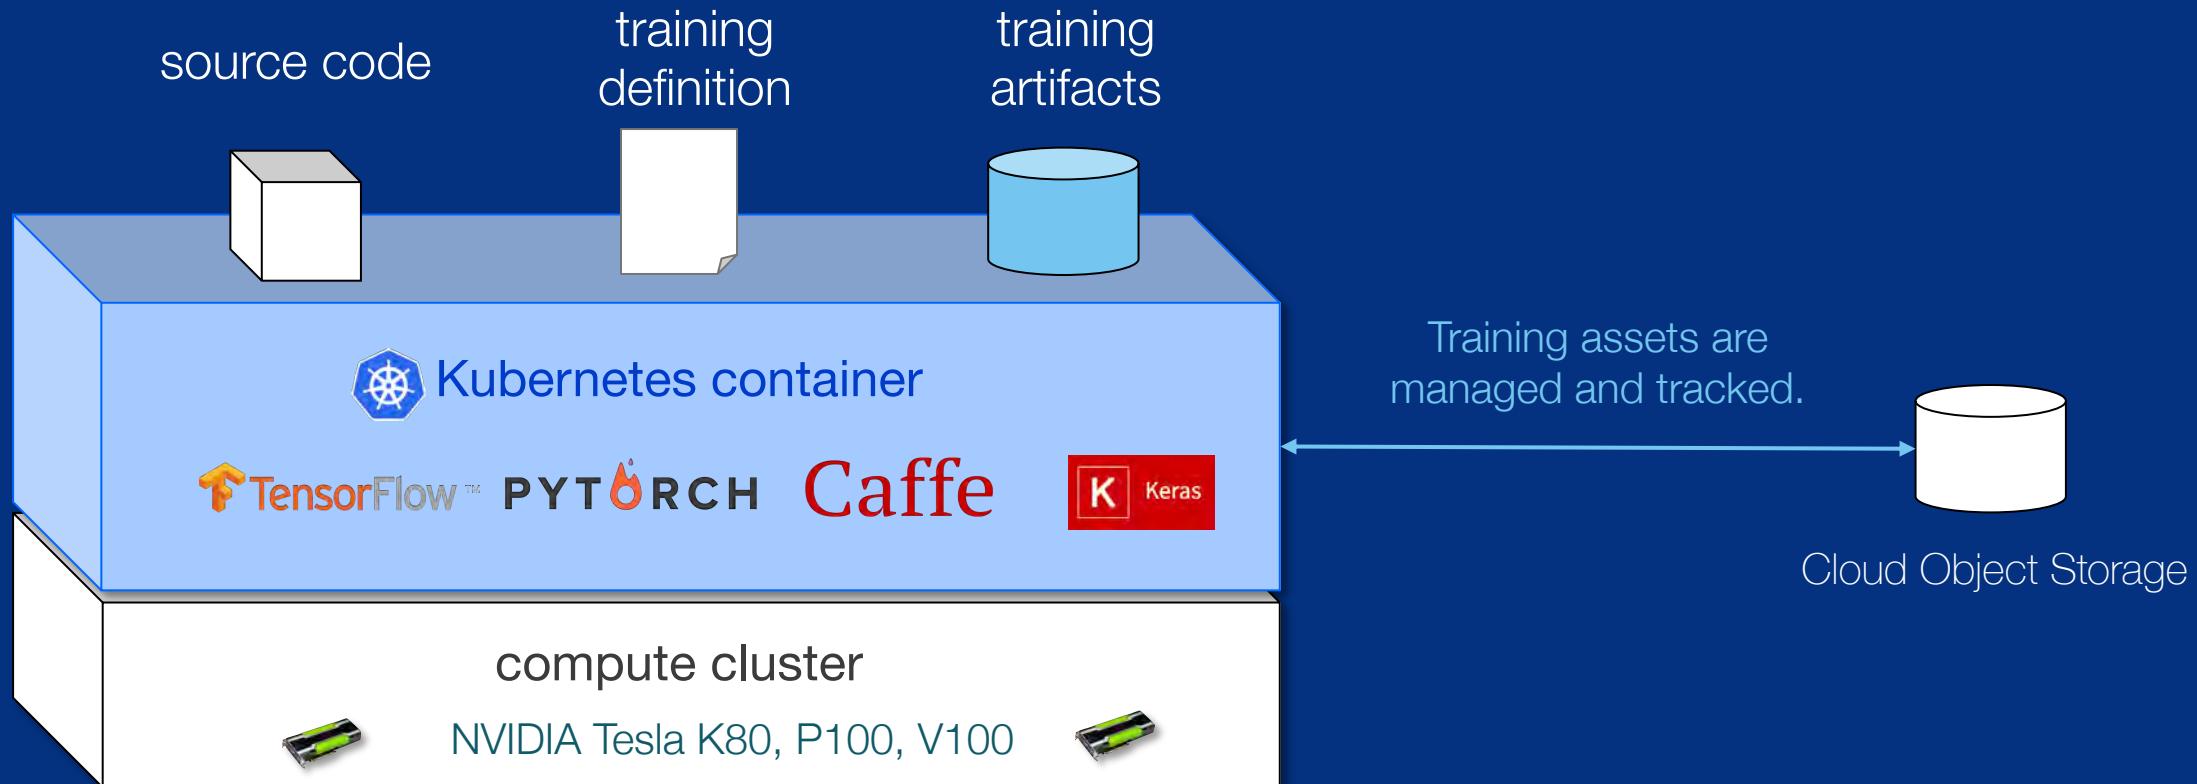

Microservices

Containers

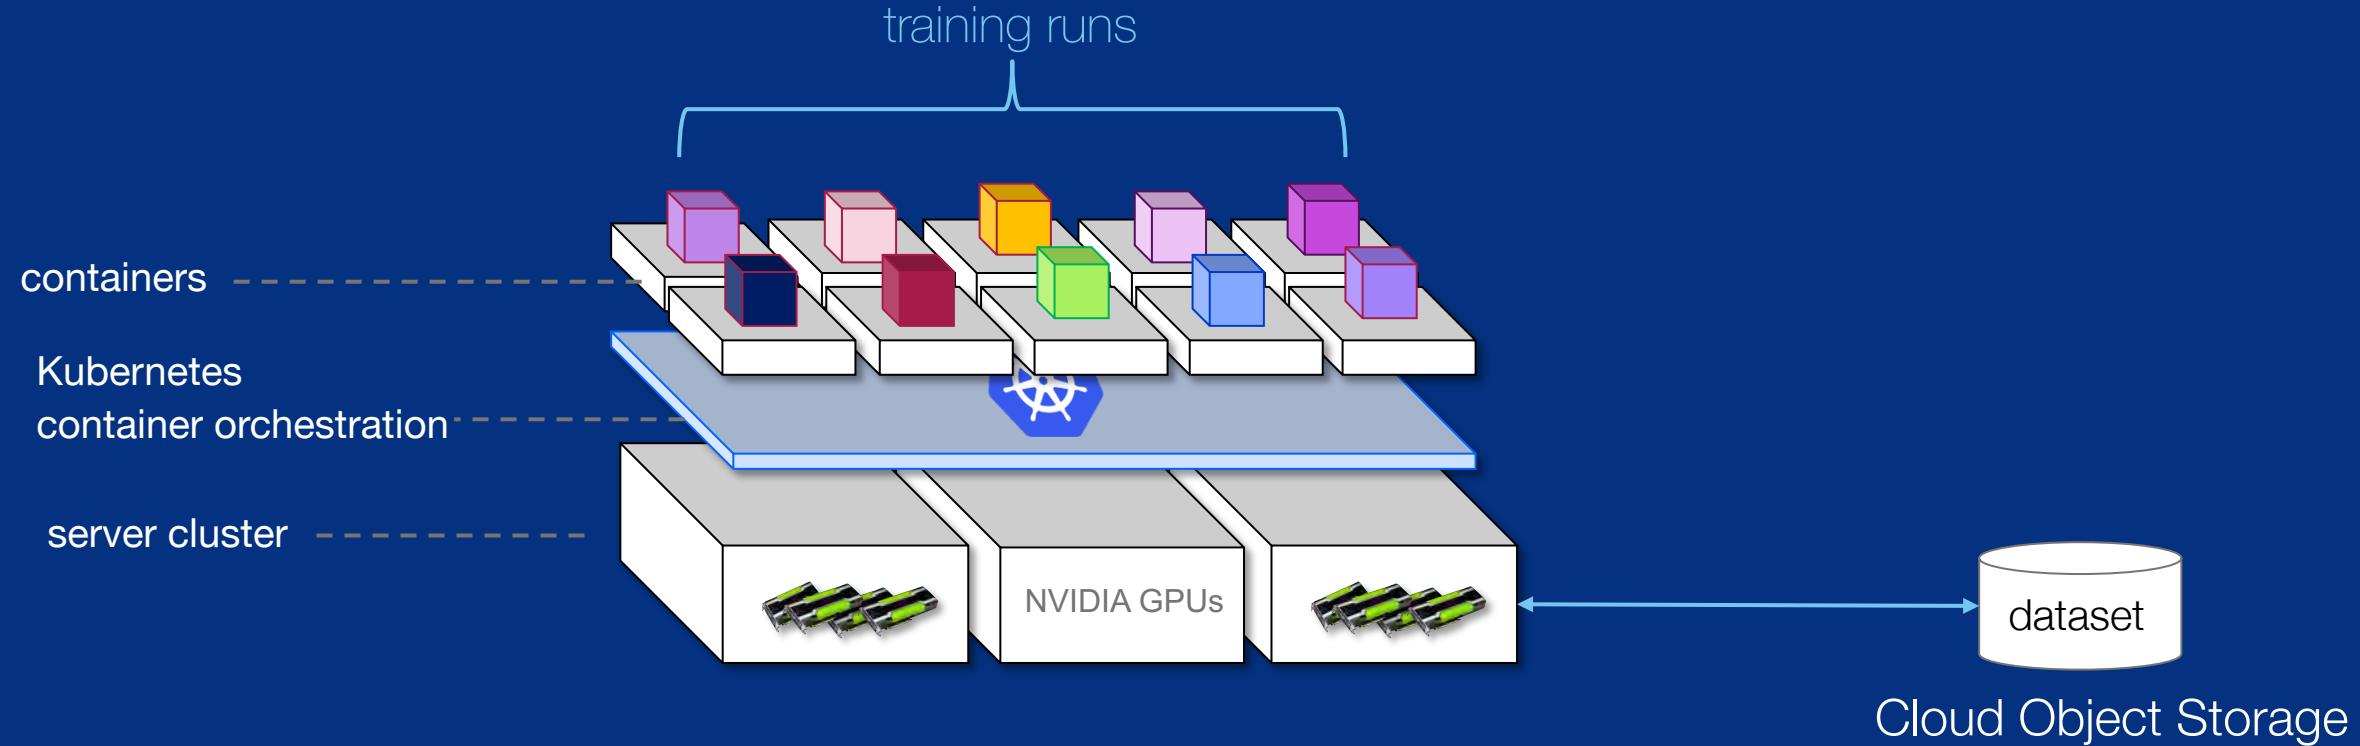

DevOps  
automation

# Access to elastic compute leveraging Kubernetes

Auto-allocation means infrastructure is used only when needed

# Model training distributed across containers

## Kubernetes is not the end game

**Kelsey Hightower**

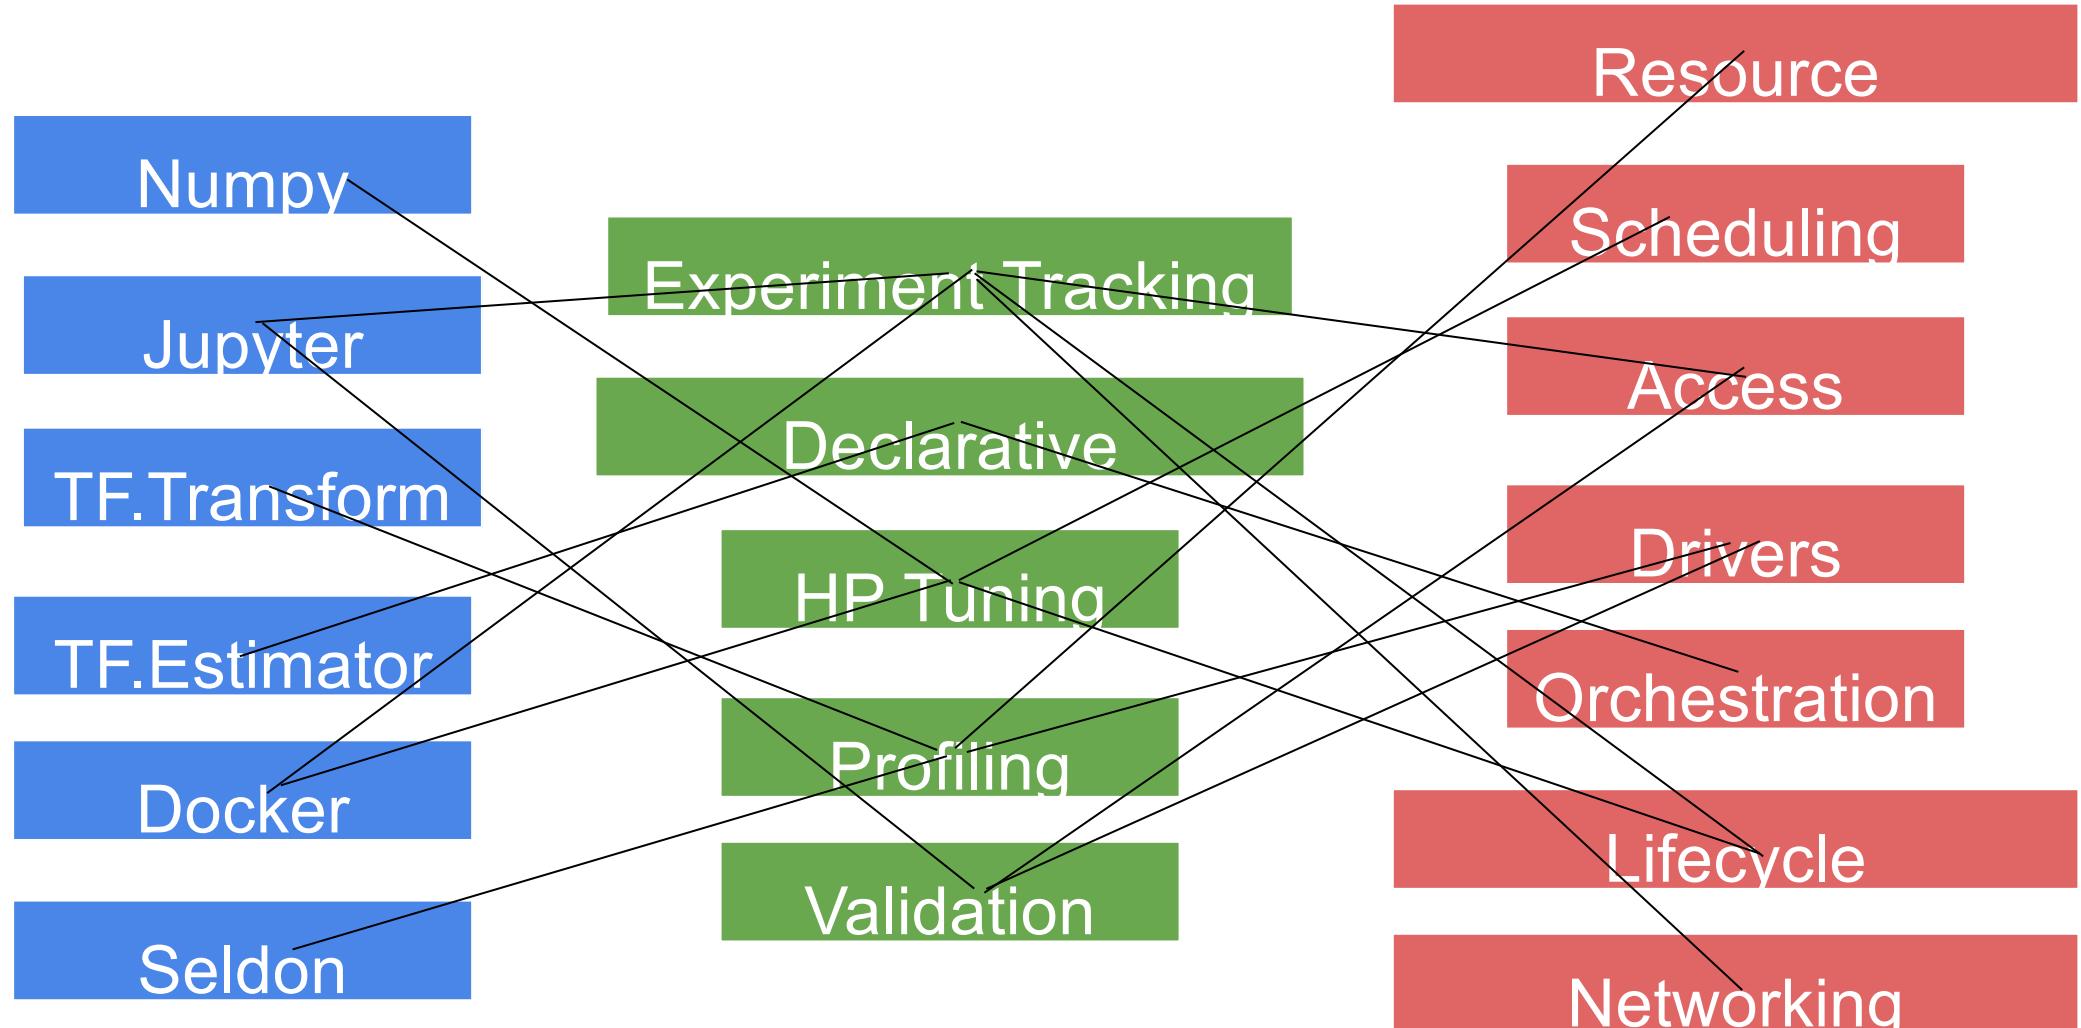

@kelseyhightower

Kubernetes is a platform for building platforms. It's a better place to start; not the endgame.

## Overview of the Kubeflow pipelines service

Kubeflow is a machine learning (ML) toolkit that is dedicated to making deployments of ML workflows on Kubernetes simple, portable, and scalable.

Kubeflow pipelines are reusable end-to-end ML workflows built using the Kubeflow Pipelines SDK.

The Kubeflow pipelines service has the following goals:

- End to end orchestration: enabling and simplifying the orchestration of end to end machine learning pipelines
- Easy experimentation: making it easy for you to try numerous ideas and techniques, and manage your various trials/experiments.
- Easy re-use: enabling you to re-use components and pipelines to quickly cobble together end to end solutions, without having to re-build each time.

## Documentation

Get started with your first pipeline and read further information in the [Kubeflow Pipelines overview](#).

See the various ways you can use the [Kubeflow Pipelines SDK](#).

See the [Kubeflow Pipelines API doc](#) for API specification.

Consult the [Python SDK reference docs](#) when writing pipelines using the Python SDK.

# Get Kubeflow up and running on a private cloud

Create a portable and scalable on-premises solution for enterprises that need to protect data

[Winnie Tsang](#), Raymond Wong | Updated September 20, 2018 - Published September 19, 2018

Containers Data science Deep learning Machine learning Hybrid Cloud

Today more and more companies use artificial intelligence (AI) to improve the user experiences for their products. These enterprises have the following goals:

## CONTENTS

Learning objectives

Prerequisites

Estimated time

Steps

1. Set up IBM Cloud Private-Community Edition

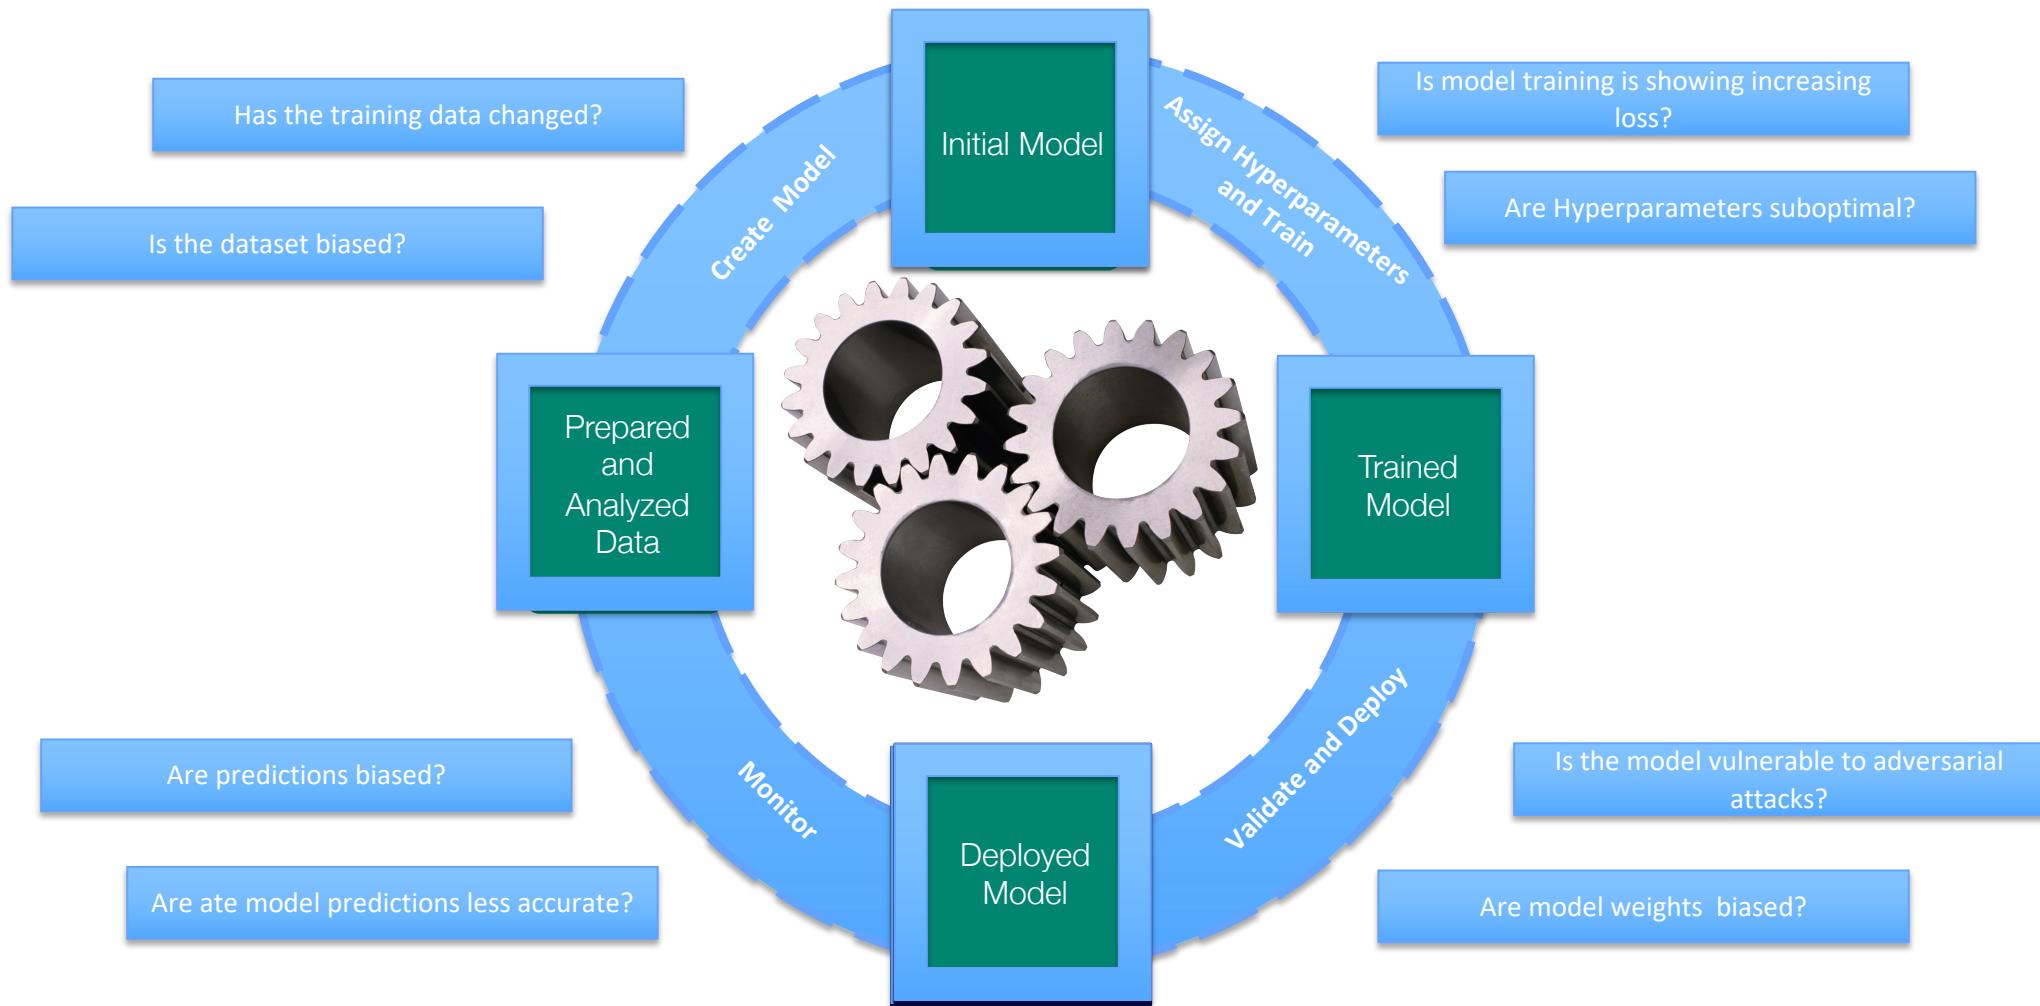

2. Set up Kubernetes CLI client for your IBM Cloud Private cluster

3. Set up IBM Cloud Private to enable GPU support

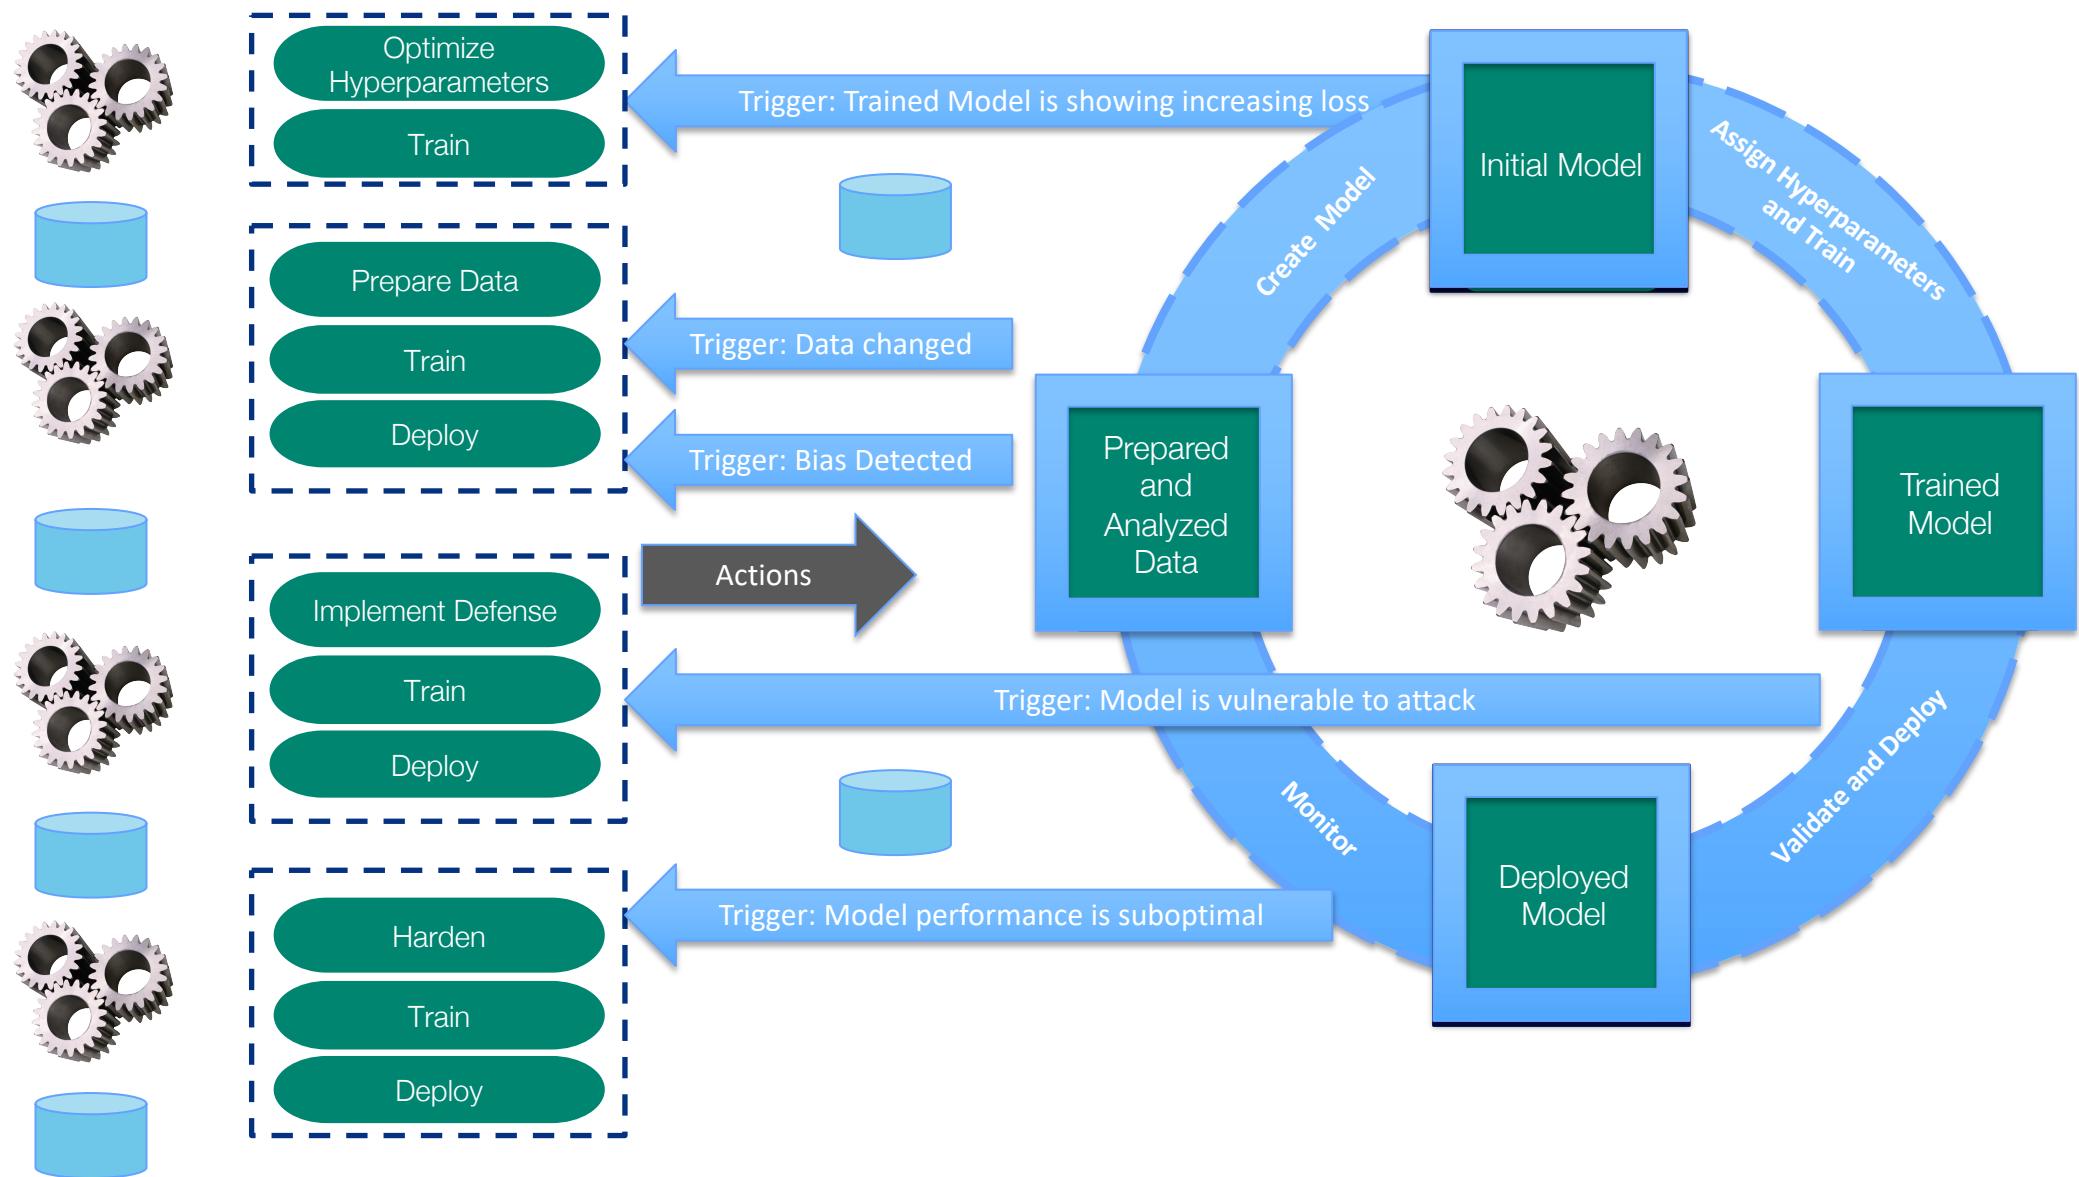

4. Install Ksonnet

<https://developer.ibm.com/tutorials/get-kubeflow-up-and-running-on-ibm-private-cloud/>

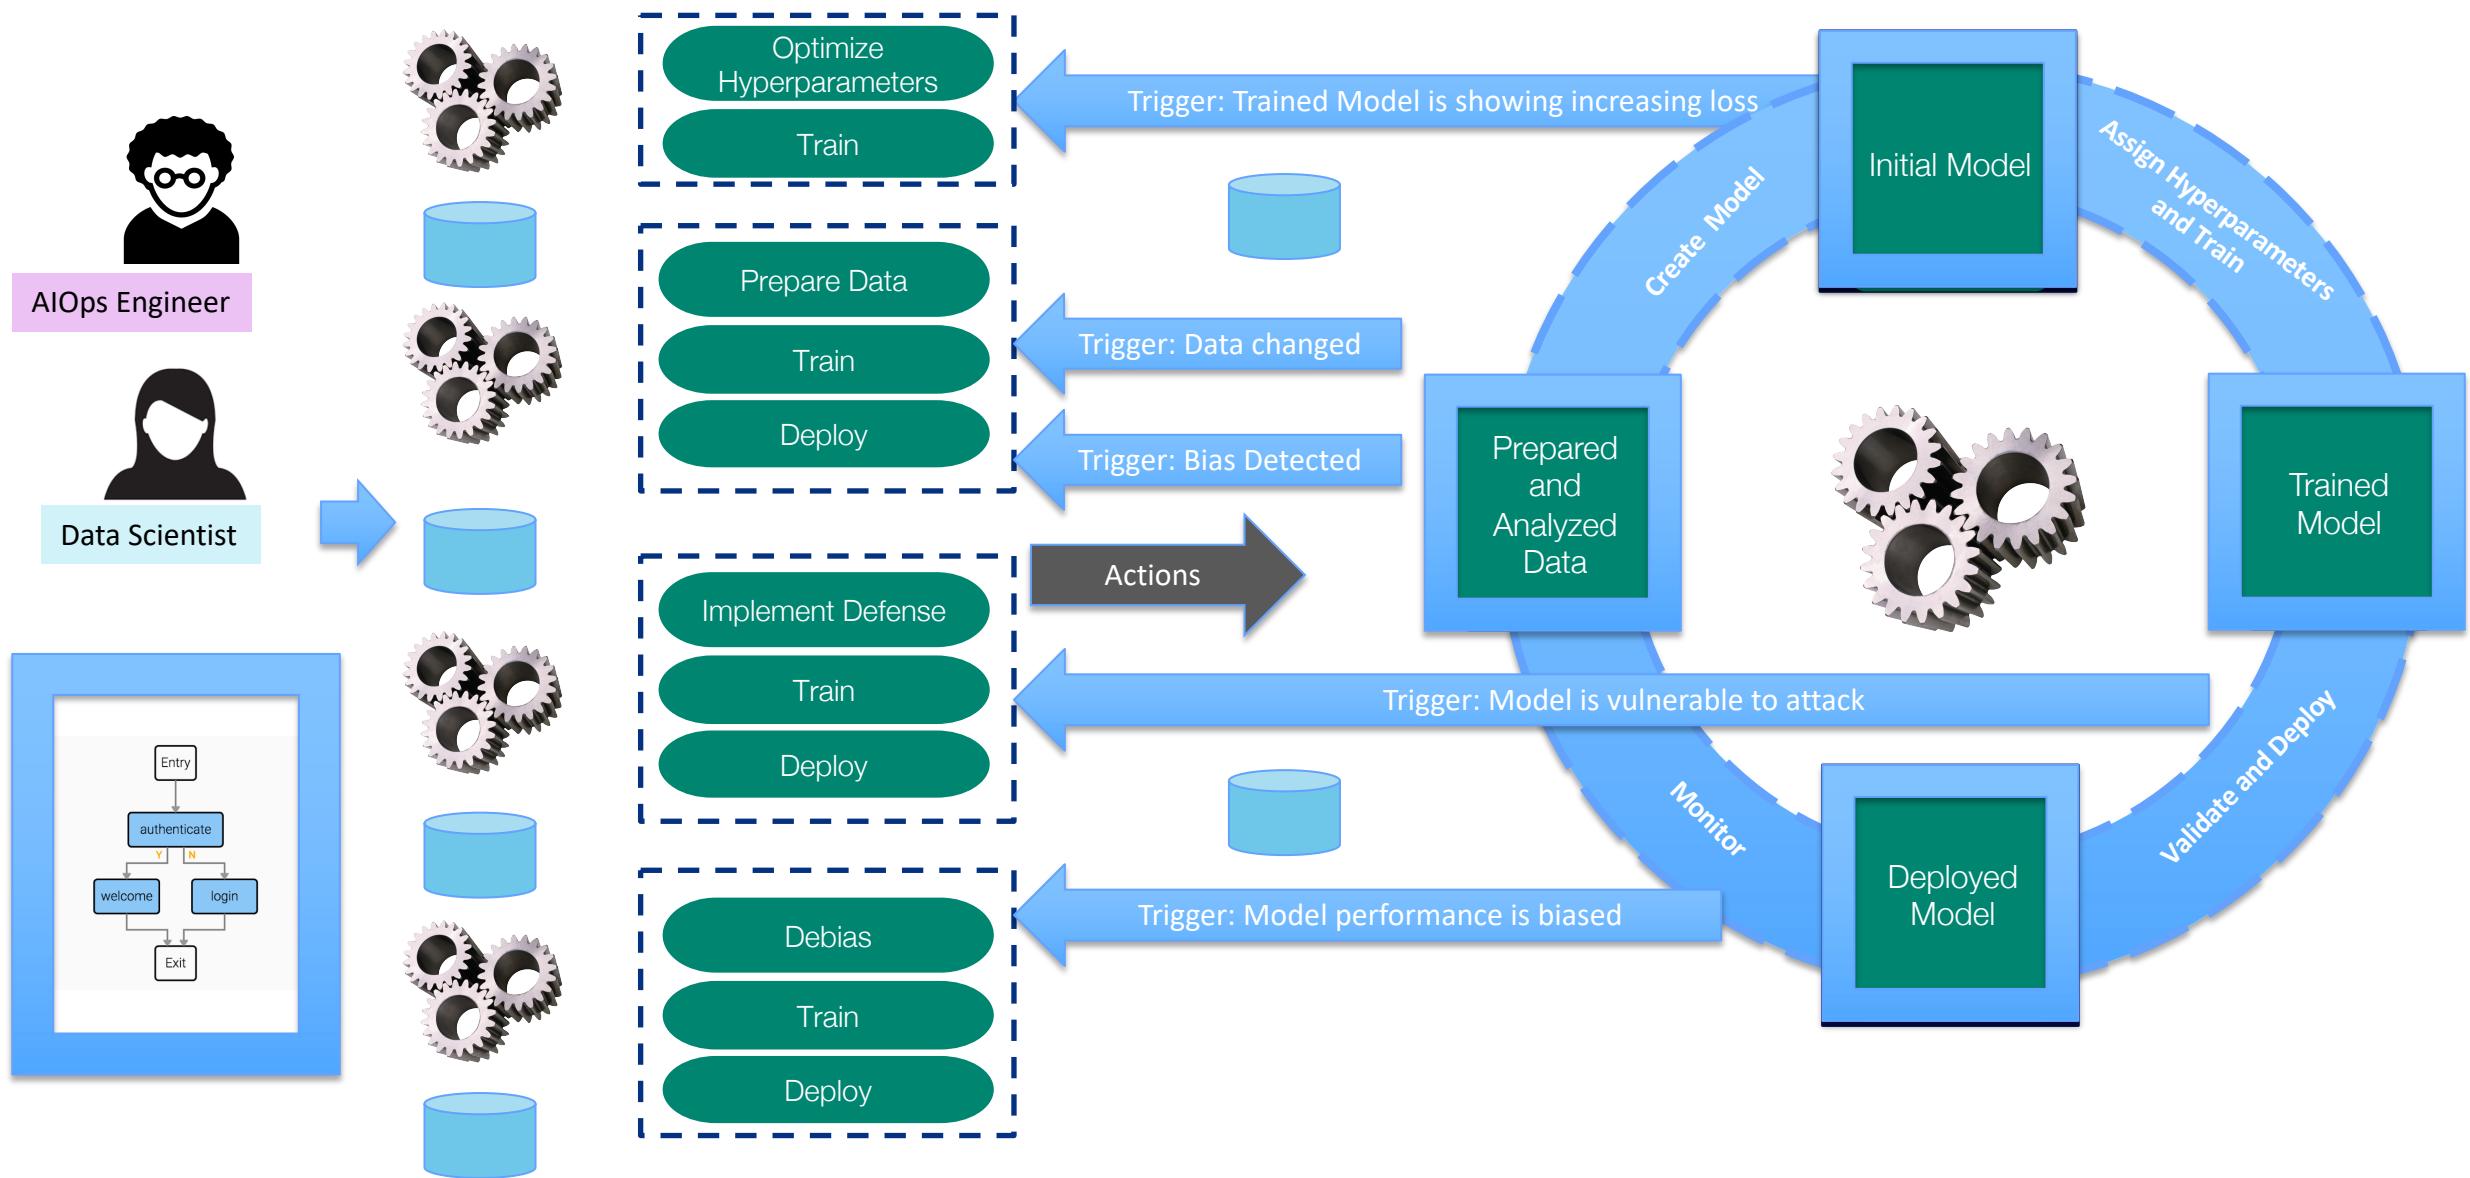

# Infact, we need a transparent, trusted and automated AI Pipeline

# Transparent, trusted, automated, event driven and auditable AI Pipeline

# Transparent, trusted, automated, event driven, auditable AI Pipeline as a Service

# Knative

Kubernetes-based platform to build, deploy, and manage modern serverless workloads.

## Build

Provides easy-to-use, simple source-to-container builds, so you can focus on writing code and know how to build it. Knative solves for the common challenges of building containers and runs it on cluster.

## Serving

Run serverless containers on Kubernetes with ease, Knative takes care of the details of networking, autoscaling (even to zero), and revision tracking. You just have to focus on your core logic.

## Eventing

Universal subscription, delivery, and management of events. Build modern apps by attaching compute to a data stream with declarative event connectivity and developer-friendly object model.

# Knative build

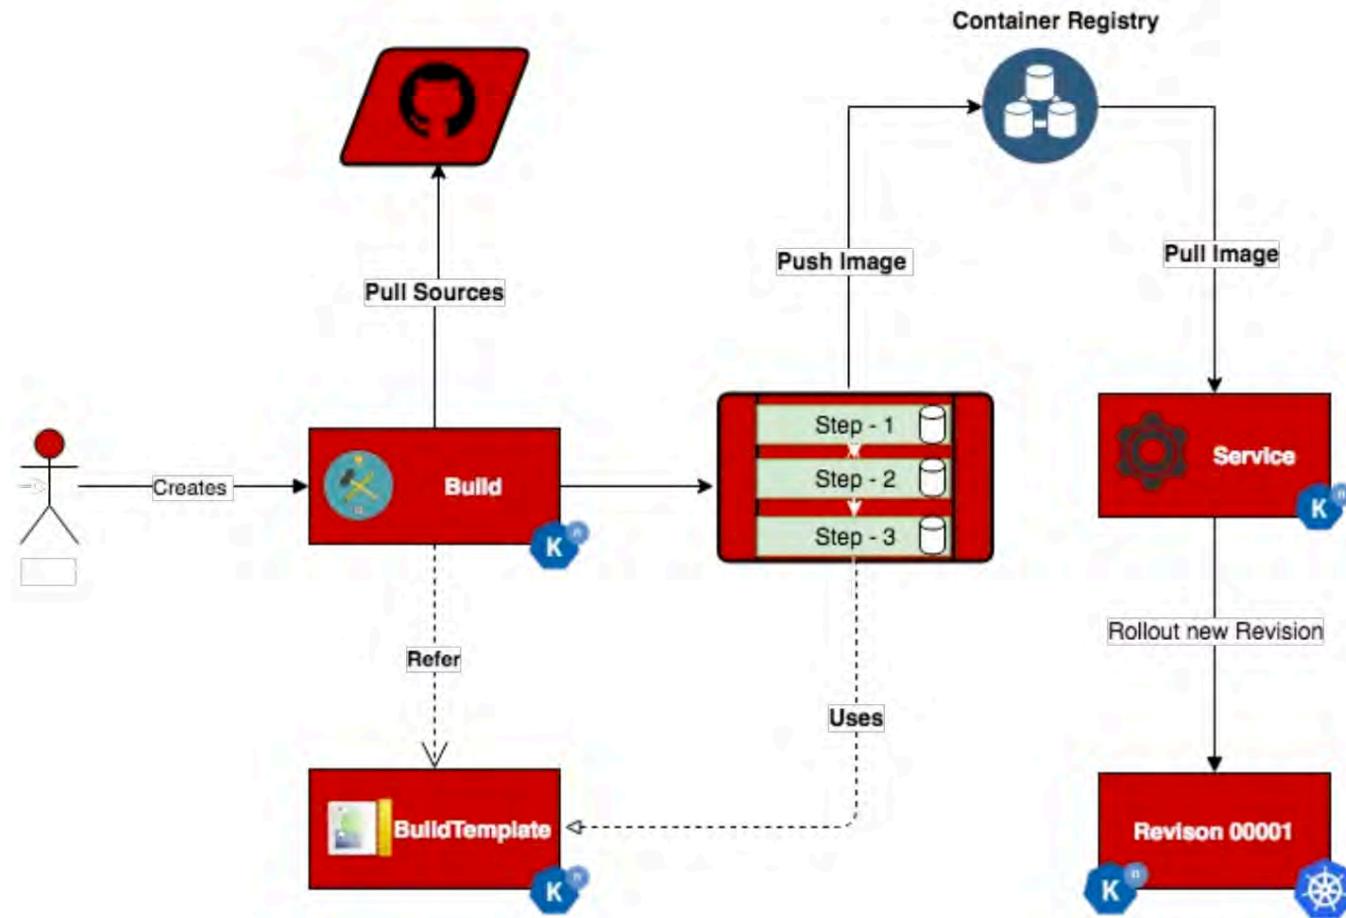

## Build — Source-to-container build orchestration

### Knative Build Components

- Build
- Builder
- BuildTemplate

For example, you can write a build that uses Kubernetes-native resources to obtain your source code from a repository, build a container image, then run that image.

- A Build can include multiple steps where each step specifies a Builder.
- A Builder is a type of container image that you create to accomplish any task, whether that's a single step in a process, or the whole process itself.
- The steps in a Build can push to a repository.
- A BuildTemplate can be used to define reusable parameterized templates.

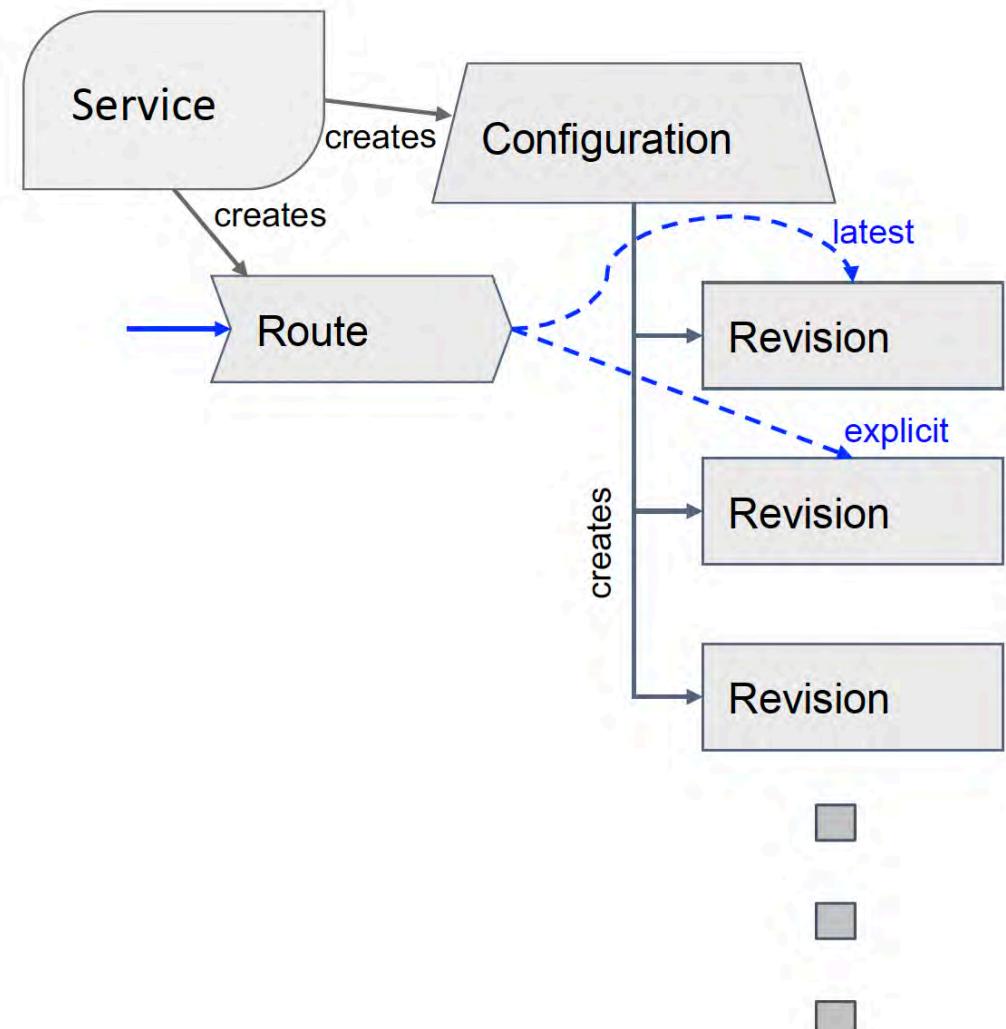

# Knative serving

**Serving** — Request-driven compute model, scale to zero, autoscaling, routing and managing traffic

## Knative Serving components

- Configuration
  - Desired current state of deployment (#HEAD)
  - Records both code and configuration (separated, ala 12 factor)
  - Stamps out builds / revisions as it is updated
- Revision
  - Code and configuration snapshot
  - k8s infra: Deployment, ReplicaSet, Pods, etc
- Route
  - Traffic assignment to Revisions (fractional scaling or by name)
  - Built using Istio
- Service
  - Provides a simple entry point for UI and CLI tooling to achieve common behavior
  - Acts as a top-level controller to orchestrate Route and Configuration.

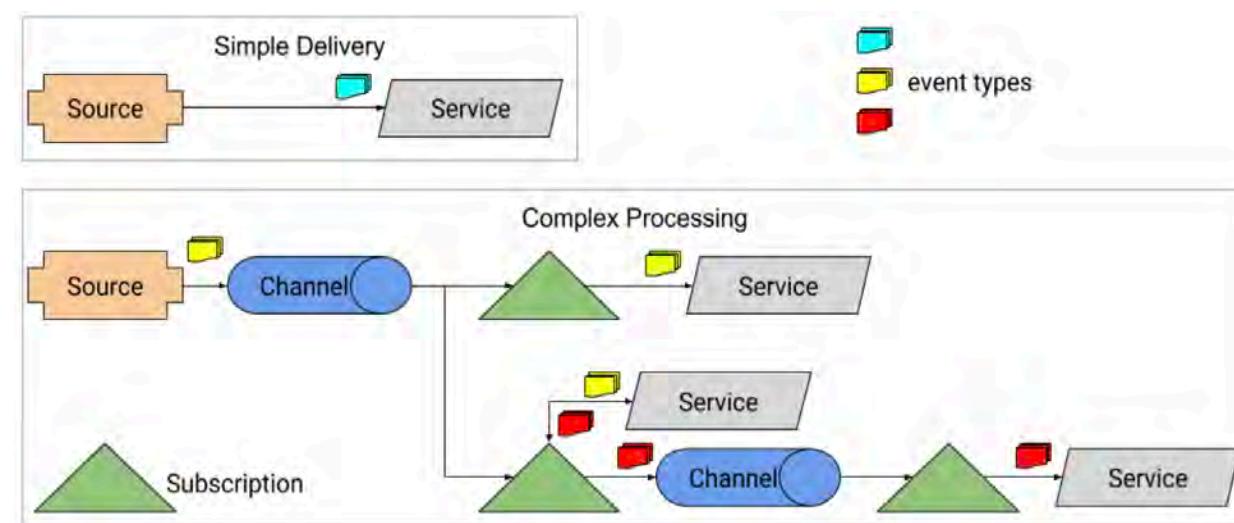

# Knative eventing

**Broker** and **Trigger** are CRDs providing an event delivery mechanism that hides the details of event routing from the event producer and event consumer.

The **Event Registry** maintains a catalog of the event types that can be consumed from the different Brokers

**Event Sources** are Kubernetes Custom Resources which provide a mechanism for registering interest in a class of events from a particular software system.

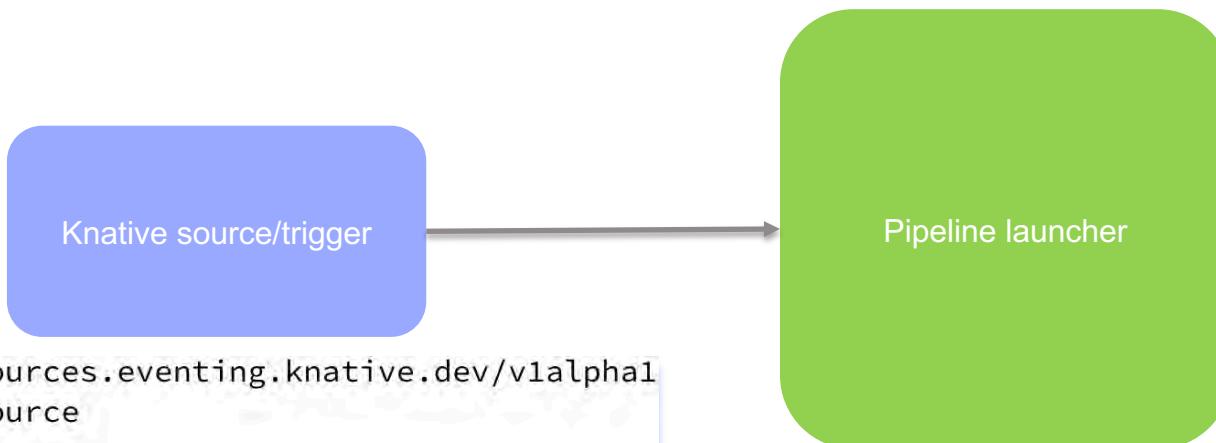

**Channels** are Kubernetes Custom Resources which define a single event forwarding and persistence layer.

# Knative eventing

Name	Status	Support	Description
AWS SQS	Proof of Concept	None	Brings AWS Simple Queue Service messages into Knative.
Apache Camel	Proof of Concept	None	Allows to use Apache Camel components for pushing events into Knative.
Apache Kafka	Proof of Concept	None	Brings Apache Kafka messages into Knative.
BitBucket	Proof of Concept	None	Registers for events of the specified types on the specified BitBucket organization/repository. Brings those events into Knative.
Cron Job	Proof of Concept	None	Uses an in-memory timer to produce events on the specified Cron schedule.
GCP PubSub	Proof of Concept	None	Brings GCP PubSub messages into Knative.
GitHub	Proof of Concept	None	Registers for events of the specified types on the specified GitHub organization/repository. Brings those events into Knative.
GitLab	Proof of Concept	None	Registers for events of the specified types on the specified GitLab repository. Brings those events into Knative.
Google Cloud Scheduler	Active Development	None	Create, update, and delete Google Cloud Scheduler Jobs. When those jobs are triggered, receive the event inside Knative.
Google Cloud Storage	Active Development	None	Registers for events of the specified types on the specified Google Cloud Storage bucket and optional object prefix. Brings those events into Knative.
Kubernetes Api Server	Active Development	Knative	Brings Kubernetes resource changes into Knative as references or as full resources.

# Deploy a Knative application using Tekton Pipelines

Learn how to use the Tekton Pipelines open source project to build and deploy a Knative app

Gregory Dritschler | Published June 5, 2019

Cloud   Containers   Serverless

Tekton Pipelines is an open source project to configure and run continuous integration and continuous delivery (CI/CD) pipelines within a Kubernetes cluster. In this tutorial you learn the following concepts and skills:

- The basic concepts used in the [Tekton Pipelines](#) project
- Examples of creating a pipeline to build and deploy a [Knative](#) application

## SOCIAL

## CONTENTS

- Prerequisites
- Estimated time
- Step 1. Understand the Tekton Pipeline concepts
- Step 2: Create a sample pipeline
- Step 3. Create a task to deploy an image to a Kubernetes cluster
- Step 4. Create a pipeline
- Step 5. Create PipelineRun and PipelineResources
- Step 6. Define a service account
- Step 7. Run the pipeline
- Tips
- Summary

# Introducing Data Asset eXchange (DAX)

The challenge: Data is the fuel for AI, but data quality, licensing, and format vary significantly

In support of open data, IBM announced the Data Asset eXchange (DAX), a place to find curated free and open datasets under open data licenses

- Standardized dataset formats and metadata
- Ready for use in enterprise AI applications
- Complement to the Model Asset eXchange (MAX)

The screenshot shows the DAX homepage with a banner at the top featuring a black and white photograph of people working in a server room. Below the banner, the title "Data Asset eXchange" is displayed, followed by the subtitle "Explore useful and relevant data sets for enterprise data science". There are two green buttons: "Learn More" and "Model Asset eXchange". The main content area displays six dataset cards arranged in a grid:

- Groningen Meaning Bank - Modified**: CDLA-Sharing | TSV Format. A subset of the GMB dataset, consisting of documents verified to be in the public domain. Tags: Natural Language Processing, Named Entity Recognition, Part of Speech Tagging.
- Contracts Proposition Bank**: CDLA-Sharing | GitHub-LU. Text from approximately 1000 english compliance sentences obtained from IBM's publicly available contracts, annotated with a layer of "universal" semantic role labels. Tags: Natural Language Processing, Language Modeling, Contracts.
- NOAA Weather Data - JFK Airport**: CDLA-Sharing | CSV. Local climatological data originally collected by JFK airport. Tags: Time Series Prediction.
- Nutch**: CDLA-Sharing | CSV | JSON. This dataset consists of raw and processed execution logs generated from two versions of Nutch, an open source web crawler application.
- Finance Proposition Bank**: CDLA-Sharing | GitHub-LU. Text from approximately 1000 english sentences obtained from IBM's public annual financial reports, annotated with a layer of "universal" semantic role labels.
- Forum Subjectivity**: CC BY-SA 4.0 | XML. A dataset of online discussion threads crawled from Ubuntu Forums, with associated subjectivity labels.

# The Community Data License Agreement

<http://cdla.io>

- Linux Foundation initiative to create a new legal framework that meets the needs of data licensing
- Enables collaboration in data much like open source licenses enable community collaboration
- IBM is a major supporter
- When possible, CDLA will be used for DAX datasets

# Together: A Transparent, and trusted event driven Open Source AI Pipeline
